the most modern sanitary ideas, are capable of dealing with
only about two-thirds of the total sewage of the city in
winter time, and that to complete the works in such a
way as to deal with the whole volume of sewage will
involve the expenditure of about 66,000*l*., in addition to
the cost already involved of about 69,000*l*. Considerable
anxiety and uneasiness have been felt in the city as to the
scheme, and a reassuring statement from an expert would
be gladly welcomed. The general purposes committee were
n Tuesday authorised to consider what further expert
dvi e should be obtained, that they should report thereon

to the Council, and, further, that the services of Major Tulloch, the engineer to the scheme, be dispensed with.

THE Metropolitan Asylums Board on Saturday considered a report presented by the works committee upon letters received from the Local Government Board suggesting modifications of the Board's proposals for the provision of a new boiler-house, workshops, &c., at the North-Eastern Hospital, the cost of which was originally estimated by the engineer-in-chief at 14,100*l*. The committee submitted plans of a further modified scheme for the erection of the boiler-house, coal storage, workshop and destructor-house at an estimated cost of 12,000*l*. The modified scheme was approved, and it was ordered that it should be forwarded to the Local Government Board for their sanction under seal.

GOLF is looked upon as not only one of the most healthy games, but also as one affording the least risk of accident to its votaries, but even golf is not exempt from its special dangers. A well-known J.P. recently lost an eye in consequence of a blow from a golf ball when playing on the Meyrick Park Links, the eye having to be removed. The sufferer was so far fortunate in possessing an accident policy with the Railway Passengers' Assurance Company, under which the sum of 500*l*. was forthwith paid.

BEFORE Judge Owen at Newport, Edward Turner, mason, sued George Banfield, collier, for 100*l*. for work and materials in connection with the building of three houses. According to defendant, Turner agreed to build the houses for 340*l*., providing he had the materials from the old houses. There was no agreement signed and there were no specifications. Several witnesses spoke to hearing the oral agreement for 340*l*. Plaintiff said he had only agreed to do the work as cheap as possible, and to draw 2*l*. 10*s*. a week as his own wages. Two witnesses said that 450*l*. would be a fair price for the work after allowing for the old materials. Others said 340*l*. would be a fair price. Judge Owen remarked there was a discussion going on in some of the papers about the value of expert evidence. Here was a case in point, where there was a difference of 110*l*. in a small amount, or 25 per cent. difference. His Honour decided that there had been no specific contract to do the work for 340*l*. It was the most loose way of building houses he had ever heard of. He gave judgment for 45*l*.

A MEETING has been held in Coventry of opponents the erection of municipal offices, with shops underneath, the Earl Street vicinity. It was resolved that the erection of municipal offices and shops should be opposed on the grounds that the present scheme is undignified for a town of the size and importance of Coventry; that the need for a town hall is urgent, and that it is not admitted that the city cannot afford a town hall; that even if the city cannot afford a town hall at the present time it is undesirable to utilise the site in such a way as to prejudice the erection of a proper town hall at a later period, or in such a way as to involve the purchase of another site for a town hall; and that it forms no part of the business of a municipal authority to speculate with the ratepayers' money in the erection of shop property. It was resolved, also, that steps should be taken to send a requisition to the Mayor to hold a public meeting on the subject, to get out a ground plan of the site and to instruct counsel to attend at the Local Government Board inquiry and oppose the application of the Corporation for a loan for this purpose.

THE London and Bath road, according to the report for the past year of Mr. R. J. Thomas, county surveyor for Buckinghamshire, is probably the most used by light motor-cars in the kingdom. He cites that a census taken at Maidenhead town hall on Henley Sunday gave an average of 107 cars per hour for twelve hours—no fewer than 1,284 motors for the day. During the year there has been an increase in road maintenance in the county of nearly 1,200*l*., and the main cause for this is stated to be the increase in the number of heavy traction engines, as well as the motor-car traffic, combined with the bad season. It has been found impossible to keep well-rolled, first quality granite down, the suction in grip of pneumatic tyres, especially those covered with projecting metal non-skid studs, tearing the smaller particles out of the road and dropping them on the hard surface, to be crushed into dust by ordinary traffic, and later swept away. A coating of granite now lasts only twelve months, whereas it had at least three years' life. In several cases tarmac has been used with satisfactory results.

NEW CATALOGUES.

The new illustrated general catalogue issued by McDowall, Steven & Co., Ltd., ironfounders, is of a size that befits so extensive a business. There are six sections, viz. (1) kitchen ranges, steam and gas-cooking apparatus; (2) stoves and fireplace suites; (3) rain-water goods and general castings; baths and sanitary fittings; (4) verandahs, railings, stairs; (5) stable fittings; (6) radiators, heaters and hot-water pipes. Each section is abundantly illustrated, and the outlay on the book must represent a large sum. Care is taken to give dimensions and prices. Those who wish to purchase any articles can therefore realise what is obtainable. But in London it would be an advantage to visit the capacious show-rooms of the company, in which each class of goods is arranged separately, so the visitor is enabled to select whatever is best adapted to his purpose. One great advantage is that the products of the Milton works are of the most modern forms or correspond with the latest conclusions of practical men. The lists introduced show the numerous modern buildings in which the appliances have been used, such as the Milton steam-cooking apparatus, which is well known throughout England, Ireland and Scotland. Captain Galton's grates are among the company's products. Then there are London County grates, which are remarkable for their simplicity. The ornamentation of the grates is always of an excellent character. And, indeed, it may be said that among the thousands of objects shown in the pages not one could be considered as ugly. That is high praise, but is not more than the character of the goods deserves.

One of the worries of householders and tenants of flats arises from unsatisfactory cooking-ranges. Attempts to improve them are generally unsatisfactory, and tenants object to the expense of introducing ranges which they cannot claim as their property. It is a great advantage of the ranges of the Wilson Engineering Company, Ltd., that they are portable. It is not to be supposed they are flimsy, for they are no less strong and enduring than those which are fixtures. Some are intended for use in large establishments, as in such places it is often convenient to change the position of a range. The Wilson Engineering Company

have many varieties, and there are also hot-closets, gas-roasters, pastry-ovens, hot-plates, boilers, besides cooking utensils. As specialists they have secured many important contracts, and frequenters of some of the principal restaurants in London have benefited by the inventions of the Wilson Engineering Company.

TWENTY years have elapsed since Mr. Horsfall introduced his "destructors" to sanitary authorities. The merits of the system have been recognised not only in this country but on the Continent and elsewhere. The destructors are used in Brussels, Hamburg, St. Petersburg, Zürich, Monaco, Neuchâtel, Cairo, Para, Pernambuco, Lorenzo Marques, Durban, Bloemfontein, Singapore, as well as in Edinburgh, Manchester, Newcastle-on-Tyne, Westminster, &c. In many hospitals it is considered to be an essential to sanitation. The long and varied experience of the company has enabled many adaptations to be realised, and these are described in the latest publication of the company. There is, for instance, a portable destructor, which can be drawn by horses and will consume at least 6 tons of refuse in 24 hours. The opportunities for so effectual an aid to sanitation are increasing daily.

At a meeting of the Llandudno District Council it was reported by the works committee that as the result of the recent storms a vast amount of shingle and sand appeared to have been moved, and the foundations of the concrete steps and of the platforms on which the shelters are erected were laid bare to a much greater extent than before. The committee were of opinion that some active measures should be taken to protect these works, and to prevent as far as possible the removal of sand and shingle, and they instructed the surveyor to give the matter his earnest attention and to report as to the best course to adopt, and, if necessary, visit for that purpose one or two of the seaside places where similar trouble has been experienced. The surveyor expressed the opinion that since 1895 no less than 50,000 tons of shingle had disappeared from the beach of Llandudno Bay.

IMPROVED SAW-SHARPENING MACHINE.

THE old process of sharpening saws by hand is being superseded by a machine perfected by M. Glover & Co. Under the old system saws had to be taken out of the benches every half-day. The new machine entirely obviates the necessity for punching, with all its drawbacks. By that means the life of the saw is lengthened, and the process of hammering can be often dispensed with. An expert sharpener can only file the teeth quite straight and sometimes he files them round. By means of the circular revolving emery wheel in M. Glover's machine the saw teeth are made slightly hollow, like a skate blade or a hollow-ground razor. This hollow-ground condition conduces to sharpness, and it is claimed that saws are able to cut better and retain the edge longer than if they were filed by hand. The means of easily adjustable contrivances, including brass indexes, all the various "angles" and "leads" required in saw teeth can be obtained by the machine, which is fitted with a motion that dispenses with all guesswork in "topping" for each gullet formed is of uniform depth. By means of the stop motion, the emery wheel is lowered to a given point for each tooth, the teeth are accurately sharpened to one height each tooth, therefore, doing an equal amount of work. More than half the teeth in a hand-sharpened saw sometimes do not work at all; they are "topped" shorter than others. The machine is fitted with a special guard and special attachment, by which the temper of the saw can be kept intact by the fine cold spray of water ejected exactly on the precise tooth undergoing treatment, and the case hardening of the saw is thus prevented. The cutting operation is continuous, as the wheel is driven steadily by a long leather belt without interruption. The machine is also kept tight by an improved arrangement

whatever be the position of the emery wheel. It frequently happens that newly-punched saws have the teeth too long and too weak, with the result that they snap off. Then again, in order to make the saws last as long as possible it has been the general practice to resort to "topping" until there is hardly any gullet or shape of tooth left, in which case more power is required for sawing, and it is more difficult to produce good work quickly. The great saving of time as well as time which the machine insures should be appreciated in all saw-mills.

CHINESE TIN MINE.

A Chinese tin mine situated about 10 miles from Ipoh, in the State of Perak, has been fitted up within the last few years with the latest English machinery, which has already paid for itself over and over again. The puddles all sheds generally are situated in a valley, so that the ore descends by gravitation from the mine proper. It is quarried by Chinese labour, and paid for per cubic yard delivered to the works, all trucks and material being supplied by the mine owner. The mine was started some four years ago, the owner having acquired the land from a coffee planter. The output of washed tin ore is enormous, and the profits proportionately great. The so-called Chinese mining is carried on, the system being as follows:—Shafts are sunk at 10-foot centres apart to a depth of, say, 50 feet to 100 feet, according to the quality of the earth met with; then from each shaft the Chinese coolies drive horizontally, going on until they meet. In this way a layer of earth is removed, 4 feet thick, and sent up the shaft in baskets, which are hoisted by means of a wooden windlass. As this layer of earth is removed wooden props are inserted, which support stout boards at the top; these keep the roof from falling in. The feet of the props rest only on the floor, and as this is being continually dug out, the props gradually sink by the pressure of the superincumbent weight of the roof and earth above. The stout boards prevent the roof falling in, but as the ground is dug out they sink with their supports, and so always keep the 4 feet clear space which enables the men to work. The method is certainly dangerous, but effective. The surface above gradually sinks as the earth is removed from below. One would think it would be

better and as cheap in the long run, to excavate over the whole area.—*Work.*

LONDON COUNTY COUNCIL AND TENDERS.

The general purposes committee of the London County Council in their last report say:—The Council is from time to time recommended to accept a tender other than the lowest. It is necessary for the committee submitting the recommendation to satisfy the Council as to the reasons for passing over the lower tender or tenders, and as reasons of this nature cannot be fully disclosed, either in a report to the Council or in debate at meetings of the Council, the question of the adequacy of such reasons sometimes occasions great difficulty when the recommendation is being considered. In these circumstances we think the Council would favour an arrangement under which the committee making the recommendation would disclose to us the material facts, in order that we might be in a position, if we were not in agreement with the recommendation, to take action thereon at the meeting of the Council. We therefore recommend that the following be a standing order of the Council:—Whenever a committee resolve to recommend the Council to accept a tender which is not the lowest, that committee shall communicate to the general purposes committee the reasons for passing over the lowest tender or tenders. Such communications shall be made in sufficient time to enable the general purposes committee to consider the matter before the date on which the Council will have before it the report containing the recommendation in question.

THE ARTISTIC TREATMENT OF CONCRETE.*

The consideration of concrete from an æsthetic point of view may strike the average cement user as inappropriate and impossible, for hitherto the term "concrete" at once suggested foundations, piers, dams, abutments, and, nowadays, it more than likely calls to mind columns, beams, floors, walls and, in fact, the entire structural parts of

buildings. But it must be evident that our experience with this new material, new only, however, in the sense of adaptation, will show that like all legitimate and substantial structural materials, it too will prove to be susceptible of artistic treatment in design. Wood and stone architecture are as old as the hills, and the art of the Mediævalist in developing true styles with these humble materials rightfully belongs to the world wonders. Brick and terra-cotta can scarcely claim quite so much distinction, although in point of artistic treatment they were brought to high development in the Gothic art of Italy. Iron and steel, however, do not fare quite so well except in a small way along the lines of purely ornamental work; for when the modern rolling mill began to turn out its product of structural shapes, and engineers discovered the wonderful possibilities of rivetted sections and connections, there was a great rush for structural iron and later for steel. Everything imaginable was made of it, and more in Europe than here. Bridges and viaducts, certain classes of business blocks and public buildings, even churches and cathedrals, all vied with one another in their architecture of iron and steel, and while some notable attempts achieved a measure of success, it required many years to develop an artistic style of design. And even at this late day, structural engineers, as a class, seem determined to ignore the application of æsthetic principles to their designs of exposed work.

But we feel quite hopeful. There has been and is much teaching and preaching of æsthetics. Schools, periodicals and municipal art societies are doing much to educate the popular taste and to create a demand for beauty in public works, and this campaign, whose influence is spreading rapidly, will undoubtedly bring designers to recognise and appreciate the necessity and propriety of combining beauty with utility in all visible constructions.

This problem will be greatly simplified in concrete work; for here, for the first time, we come to deal with a plastic material which can be moulded and modelled at will. Beauty, however, in structural design is worthy of the name only when, like beauty in nature, it has character. It must not be a servile copy of the style peculiar to some other material, but in fact must express the individuality of its own nature and must not dissemble.

It is just this peculiarity that we must be careful of in our concrete block architecture. At present the tendency in the manufacture of these blocks is to imitate split face of stone ashlar. This is radically wrong in principle and should not be tolerated. A flat, smooth face will always look well. However, if a pitched or split face is desired, let it be produced by casting the block flat and then pitching off the face with chisel and hammer just as is done with stone. The clean fracture of the concrete thus exposed will be eminently effective and artistic, and will have all the merit that belongs to truthfulness. Plain concrete ashlar walls might in some cases be effectively relieved by the introduction of bands of decorated blocks with some simple ornament moulded in the face, very much as is done with terra-cotta, but by all means avoid moulded rock-face work. It is artistically bad. The frequent and constant repetition of a few regular sizes and patterns ruins an effect which should be counted largely as accidental, but always expressive of a fine artistic sense in the selection and grouping of the individual blocks. Artificiality, imitation and misrepresentation are stamped all over such work, and can be recognised at first glance.

Solid concrete walls have a great advantage over block walls in that they lend themselves much more readily to artistic treatment. This is especially true where they are used in suburban and country buildings, perhaps because of the touch of nature in the surrounding landscape which more nearly accords and harmonises with the broad treatment that can be so effectively employed on wall surfaces. Perhaps the best sources of inspiration that can be had for such treatment are to be found in the Spanish missions of California, which, although not concrete, nevertheless at once suggest its use, and above all are fine examples of the artistic value of broad wall surfaces relieved by exquisitely proportioned openings judiciously spaced and not infrequently embellished by moderate use of ornamentation.

Let us say then, speaking of Domestic architecture where walls are made of solid concrete the surfaces should be as unbroken as possible, avoiding especially artificial jointing, of which such frequent use is made, obtained either by scratching a joint into the fresh mortar while the surface is plastered, or after the removal of

Are you interested in WOOD PRESERVATION

Apply to the ANTHROL Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of ANTHROL and describes the very simple and inexpensive methods by which it is applied.

It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. ANTHROL does not require expensive pressure-plant; does not reduce the mechanical efficiency of the timber; does not increase the liability of the wood to inflame; does not render the wood poisonous to human beings or domestic animals; and does not leave the surface of the wood black and unpleasant to handling—on the contrary, ANTHROL, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The **ANTHROL** COMPANY, Kinning Park, GLASGOW
and 6 Crosby Square, LONDON

forms, or by planting bevelled wood strips on the inner face of the forms, thereby moulding the joint directly into the concrete.

Both methods are highly objectionable, utterly senseless and aesthetically very bad, and should be shunned. In work of moderate cost, where effects are to be sought in an inexpensive, straightforward and natural way, there can be no offence taken if the concrete is left untouched after removing the forms. In fact, this method has so much merit that it might with perfect propriety be classed as the most thoroughly artistic. That is probably just what the builders of the old Spanish missions would have done if they had had concrete to use for their buildings. To be sure, if such treatment is to be used, some care should be exercised in the preparation of the formwork, so that it will not result in the effect of a lot of patchwork.

In more pretentious work several methods of treating the exposed concrete are available. A thin skin or crust of port cement usually is found to cover the surface where concrete was deposited wet and was well tamped. This crust may be removed while still soft by means of a stream of water having some force, or by stiff wire brushes, in which cases the forms must be removed promptly and just as soon as the work will stand it. This, however, involves considerable danger and should be done only by thoroughly experienced persons. If successfully accomplished, the effect of the rough surface thus produced is good and consistent, for it exhibits the material in its true nature and avoids all semblance of artificiality.

This treatment, however, entails so many difficulties that it will not be very popular, and it will be advisable to adopt some other simpler and safer method giving similar results. The surfaces can be tooled all over with a chisel and some classes of stonework, but while the result may be effective, it is rather expensive and slow work and will therefore be but sparingly used. It is difficult, too, to avoid loosening an occasional pebble or stone and thus spotting the surface with objectionable blemishes, and possibly opening up some internal cavities which are quite apt to occur and so starting a leak in the wall.

A simple and inexpensive yet thoroughly practical method of securing an artistic effect consists of covering the wall surface with a splatter-dash coat of cement mortar

applied by splashing it on with a paddle or a broom, or, better still, it may be first spread on with a trowel and then roughened by stippling with a stiff broom or brush or even a flat board, in which case the roughening is obtained by suction against the board. When such treatment as this is to be used, it may be highly appropriate in some cases, and, indeed, quite interesting, to decorate parts of the surface with some simple panelwork or freehand modelling. In case of panels it is best and simplest to adopt sunken work, as this can be readily produced by merely planting a board or block of desired shape against the inside face of formwork, which leaves its impress upon being removed from the concrete. Or else a reverse mould made of some artistic bit of carving for a panel, or over a door or window, or a frieze, &c., may be nailed against the forms, and the resulting impress will be thoroughly effective, although a much higher artistic value would be due such work if it were modelled by hand directly in the cement mortar as it is applied and before it has had a chance to harden.

This sort of work is being done extensively and successfully in Germany, where the modern style of "Nouveau art" presents abundant opportunity for endless designs. It is already finding much favour in our own country and ought to reach a high degree of development.

Mouldings, especially in continuous courses, if attempted at all, should be of the simplest possible design; bold, yet of moderate projection and free from small delicate members. Square effects and bevelled projections serve very well in the place of conventional moulding, and rather accentuate the character of the work and heighten its effect. Dentils of fair size can be worked in to good advantage and with comparatively little difficulty. Such work should, however, be used sparingly, on account of the impracticability of treating the surface of the resulting small members, unless great freedom and latitude are allowable, without detriment to the artistic character of the design. It is particularly difficult to do this in case the walls are to be plastered over with cement mortar. Where this is done, the work should be finished under the float rather than the trowel, so as to minimise the tendency to crack or craze, a great source of annoyance and disfigurement. Trowel finish, furthermore, almost invariably produces a

series of blotches of different shades and textures which, if introduced into rough work, have much artistic value, but must be classed as nothing better than blemishes in smooth trowelled surfaces. Moreover, it is extremely difficult and well nigh impossible in plastering over moulding or projecting band-courses, to keep the edges straight and true as they should be in smooth finish, with the result that the poor slovenly workmanship imparts an air of cheapness and flimsiness to the building instead of the reverse, value and substance.

Such then are some of the readier methods that can be employed in producing artistic effects with concrete. This humble material, so replete with possibilities, but as yet so little understood, is manifestly destined to take an important place in the construction of our buildings and must therefore strongly influence their design. But it means long, continuous and close observance and study of its nature, its possibilities and its limitations. If our designers will devote themselves sufficiently to this subject, as it so well deserves, they will discover in concrete a new and useful friend, and with its help will evolve a new architecture, full of life and character, strength and dignity, and all else that goes to make up a living style.

EDINBURGH BY-LAWS.

At the Edinburgh Dean of Guild Court Mr. George Marr, solicitor, asked to be allowed to deviate from plans previously before the Court in regard to two tenements at Piersfield. Lord Dean of Guild Wilson said the Court could not approve of the deviation so far as the piers were concerned, and Mr. Marr pointed out that the burgh engineer's inspector gave his approval to their erection. The Dean said that was not according to their information. The applicant had gone in defiance of his warrant, and the Court could not and would not grant warrant for these piers. The Court took exception to the piers on the question of their strength, and on their recommendation the petitioner agreed to put up iron pillars alongside of the piers to strengthen them. That had not been done, but something different.

Mr. Marr said his client was quite willing to do that. No full inquiry had been made, and they were quite satisfied that the building material would be sufficient and satisfactory. Provided the buildings were structurally of sufficient strength, he thought he was entitled to have what asked for, though he might have been guilty of an offence and subject to a fine. It was assumed that the material was sufficient and that it was approved of.

The Dean asked how that could be assumed when the Court never saw what was being done? They expected the petitioner would build according to the warrant granted, but instead of doing what he was asked to do, he had put up brick piers instead of stone ones. The question of brick piers was never before the Court at all. The inspector reported on the case from time to time, and the petitioner, though he got warning about it, persisted in the work.

Mr. Marr: No, I was never warned as regards the piers. I got no intimation that the piers were considered unsatisfactory. That is the point on which my case rests.

The Dean: You never could have got the Court to sanction piers such as you have built. I do not consider them built at all in the proper sense of the word. The foundations are not good to begin with, and the piers built with blue brick. And what sort of mortar have you used? It was mixed with soil, and the Court would not allow that. The public must be protected.

Mr. Marr asked if the case could be continued, and the Dean, in replying, said they would be quite prepared to do that, but on no account would they allow the piers to exist as they were. They must come down, and when they came down they must have proper foundations.

Mr. Alexander Mitchell, the builder, pointed out that they took down the piers the whole building would fall.

Mr. Marr thought they were entitled to have a clear pronouncement of the Court as to what they were required to do. He was advised that he was entitled to rely upon the burgh engineer's inspection. They were desirous of doing everything possible to make the building satisfactory to the Court.

The Clerk of Court (Mr. David Lyon) said it was not for the Court to prescribe; it was for the petitioner to make another suggestion, and it would be considered.

6-11 IMPERIAL BUILDINGS,
LUDGATE CIRCUS, LONDON, E.C.

Dear Sir,—We beg to call your attention to the above paper, which appeals directly to a large section of the public. It is practically a new paper—grafted on two old-established periodicals with which it is now incorporated and gives a full reflection of the building industries. Its pages contain information useful to all; it should be carefully studied from end to end.

Issued to meet the trend of the times at a popular price, it contains as much of everything interesting to be engaged in building operations as any of the higher priced papers.

It is not too much to say for ourselves, and we state it with every confidence, that a year's subscription to "THE BUILDING TRADE" is one of the best investments anyone connected with the industry can make.

We trust we may have your assistance in making our new venture a great success, and shall be glad if you will fill up the accompanying Order Form and forward it as soon as possible.

Faithfully yours,

GILBERT WOOD & CO., Ltd.

P. A. GILBERT WOOD, Managing Director

ORDER FORM.

Please send me "THE BUILDING TRADE" every week until further notice.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

CASTLEFORD.—March 3.—The Governors of Castleford Secondary schools invite designs from architects practising in the West Riding of Yorkshire for a dual Secondary school, &c., for 300 scholars. Premiums of 50l. and 25l. to be awarded by Mr. W. H. Brierly, the assessor. Deposit 10s. 6d. Mr. A. Wilson, clerk to the Governors, Station Road, Castleford.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20l. and 10l. will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

IRELAND.—Feb. 6.—The Galway Board of Guardians invite plans and estimates of a proposed fever hospital. The premium of 25l. will be merged in the architect's fees if the winner carries out the work. Particulars from Mr. R. F. Mullery, clerk to the Union, Galway.

CONTRACTS OPEN.

BARROW-IN-FURNESS.—Feb. 4.—For the erection and completion of proposed witnesses' rooms at the police-court. The Borough Engineer, Town Hall.

BIRMINGHAM.—Feb. 5.—For alterations and additions to the warehouses and buildings in the occupation of the Severn and Canal Carrying Co. at the Worcester Wharf. Mr. W. F. Hobrough, local engineer of the Worcester and Birmingham Canal, Stoke Prior Wharf, near Stoke Works Station.

It is generally recognised that the railway companies offer the public from time to time cheap excursion facilities to a large number of health and pleasure resorts. Such facilities, however, do not meet the case where an individual is invited to spend a week-end with a friend if his residence happens to lie off the beaten track of popular places. The Great Central Company have instituted an arrangement whereby first and third-class tickets are issued by any train every Saturday at a single fare and a quarter for the double journey from London, Marylebone, to a large number of cities and towns in the Midlands and the North. Passengers are allowed to return by any train on the following Sunday or Monday. Full particulars can be obtained at Marylebone station and at any of the Company's town offices or agencies.

MARPEDO WHITE JAPAN

SLOW DRYING.

Suitable for either exterior or interior High-Class Decorative Work, invaluable to Architects, Decorators, Ship and Yacht Builders, Railway Companies, &c. It is easy to manipulate, and large areas can be covered evenly. When dry it presents a hard, brilliant and durable surface, which will not crack. On properly prepared surface one gallon of MARPEDO SLOW-DRYING WHITE JAPAN will cover about 80 square yards. It dries in about 12 hours.

TRADE NOTES.

MESSRS. HAHN & Co., timber importers, of Alexandra Wharf, Victoria Docks, London, E., inform us that they have altered their telephones, and they are now 1374, 1375 and 1376 East.

THE New Holland Council schools are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

BEFORE specifying for paints, architects should read the small handbook concerning "Velure," which Messrs. C. Chancellor & Co. have issued. "Velure" paints having been used for royal and other yachts, in Government buildings, for hospitals, in baths, gasworks, &c., have undergone severe tests which have proved their endurance.

WE have received from Messrs. Wm. E. Peck & Co. a very neat desk calendar issued with a sample of the "Samson" solid braided sash line, copies of which they will be pleased to forward on application. The merits of the "Samson" cord are now widely known. The care taken in manufacturing the various sizes, ranging from 3-16th inch for sashes weighing up to 10 lbs., to 3-8th inch for sashes heavier than 90 lbs., accounts in a great measure for its durability.

MANY builders in the Metropolis believe that to store timber on their own premises adds too much to the cost of the material, owing to the high price which has to be paid for land. They find it is far more economical to trust to timber merchants. In eastern London Mr. E. C. Young has provided a stock of timber in his yard in Virginia Road, Bethnal Green, which is equal to meet all emergencies. Not only timbers required in everyday use, but mahogany, walnut, teak and other varieties are obtainable without delay. Ready-made balusters, newels, brackets, and it may be said whatever is needed in machine work, can be found on the extensive premises. The arrangements are adapted to meet builders' requirements promptly, carefully and economically, and Mr. Young's success since he started augurs well for his good fortune in the future.

THE directors of the Theatre Royal, Dublin, propose to expend a large sum on the erection of a winter garden as an annexe to the theatre.

MR. E. H. BALLARD, of Doncaster, is the architect for a new wing to the Yorkshire Institution for the Deaf and Dumb, at Doncaster.

THE architects for the new boiler and engine-houses being erected for the Accrington Gas and Water Board at a cost of 5,449*l.* are Messrs. Haywood & Harrison, of Accrington.

THE architectural practice recently carried on by Mr. Walter Slater at 9 High Street, Wrexham, has been purchased by Mr. C. D. Rutter, who will carry it on in future under his own name.

SOME time ago work was found for eighty-nine unemployed at the Salford sewage works in connection with the clearing away of an embankment between two sets of trestles. Of this number twenty-three discharged themselves and only one has completed sixteen weeks' work.

THE Dixon House Cricket Club, formed by members of the head-office staff of the Associated Portland Cement Manufacturers (1900), Ltd., held their sixth annual Bohemian Concert on Wednesday, the 30th ult., at King's Hall, Holborn Restaurant, Mr. Herbert E. Brooks being in the chair. A most excellent programme was presented and thoroughly enjoyed by the large audience present. The artists, stewards and concert committee are to be congratulated on their successful efforts.

THE War Office scheme for the enlargement of the buildings of the Royal Military College at Sandhurst is now in progress. It is intended to increase the accommodation to twice the present size, so that 700 officer cadets can be constantly under training. The plans for the extension have been sent down to the Barrack Construction Department of the Royal Engineers at Aldershot, and the work is to be commenced at once, the estimated cost being 186,000*l.*

THE Lichfield City Council considered last week the appointment of a city surveyor and sanitary engineer in the place of Mr. Emerson Brooke, who has resigned. A sub-committee reported that they had selected six from the 214 candidates, and these were interviewed by the Council. Eventually Mr. W. B. Chancellor, surveyor to the Brownhills Urban District Council, was appointed. The salary is 200*l.* per annum.

THE brick manufacturers in the Oldbury, West Bromwich, Rowley and adjacent Black Country districts have agreed that the price of common bricks will be advanced 1*s.* per 1,000 on February 1. They state that the prices of coal and other articles largely used in making bricks have been advanced considerably lately, the effect being that producers are not obtaining a fair amount of profit, whilst in some cases the common-class bricks are being sold below cost price. It may be mentioned that the rate at which common bricks are being sold at the present time is 5*s.* or 6*s.* per 1,000 below what it was six years ago.

INFORMATION has been received at the Board of Trade from the Italian Consul-General in London to the effect that the committee of the Palermo hospital are calling for tenders for the construction of new buildings at an estimated cost of 2,705,538 lire (about 108,222*l.*). Contractors prepared to undertake the work must send documents (plan, specifications, &c.), to the secretary of the hospital at Palermo, and deposit an amount as caution money not later than eight days before April 5 next, when tenders will be opened at 4 P.M. Further particulars may be seen at the Italian Consulate General in London, 44 Finsbury Square, E.C.

SIR WALTER PHILLIMORE has made an offer to the Kensington Borough Council, through his estate agents, to

THE LARGEST MAKERS OF WEIGHBRIDGES IN THE WORLD.

Capacity
5
to
200
TONS.

Avery's Self-contained Truck Weighbridge.

& T. AVERY, Ltd., Soho Foundry, BIRMINGHAM.

surrender land 542 superficial feet in area for the widening of the southern portion of Hornton Street, leading into Kensington High Street. The ground is of considerable value, but it is pointed out that "by reason of his interest in the borough he does not ask for any payment." The works committee recommend that the offer be accepted, the sum of 45*l.* to be spent by the Council in making the requisite alterations.

THE King's Norton and Northfield District Council held a meeting last week in accordance with statutory provisions to deal with the Bill which the Council are promoting to obtain further powers in respect to tramways, electric lighting and main roads, and to make better provision for the good government of the district. The Chairman announced at the beginning of the meeting that the threatened opposition of the builders to the Bill had been withdrawn, on the undertaking being given to make it clear that the Council did not claim a right to original plans and drawings, and on accepting the gravelling of courts as an alternative to flagging.

At the Salford County Court, before his Honour Judge Parry, it was stated that a labourer had twisted his knee on October 31 while employed on the conversion of a chapel in Greengate into a warehouse. The staircase upon which he fell was covered with debris at the time he was asked to ascend it by his employer. The defendant urged that compensation was not recoverable under the Act owing to the fact that the building was merely in course of conversion and not in process of demolition. When a substantial part of a building was left standing and incorporated into a new building there was no demolition. His Honour said it was clear that the building was being partially pulled down, and that under judgments of the House of Lords partial demolition must come within the meaning of the word "demolition" and not within that of the words "construction" or "repair." Why the Act of Parliament should leave out this particular act of partially demolishing a building over 30 feet in height he was unable to say. He certainly regarded this as one of those miserable points which would probably not trouble their brains after July 1. He awarded the plaintiff 8*s.* a week from fourteen days after the accident until March 1, to be followed by a declaration of liability and a nominal award.

LIBRARY AND MUSEUM FOR PLYMOUTH.

THE decision has been given in the competition for the new free public library and museum for Plymouth, by Mr. Henry T. Hare. Mr. Hare's award was as follows:—

- 1st, Messrs. Thornley & Rooke, the Crescent.
- 2nd, Mr. J. Leighton Fouracre, Garden Street.
- 3rd, Mr. John H. Vincent, Garden Street.
- 4th, Mr. B. Priestly Shires, Old Town Chambers.

The building is designed to fill in the entire length of available frontage to Tavistock Road, at present vacated with the proposed new buildings, screening as far as possible the somewhat unsightly returning walls of the existing shops in that thoroughfare.

The library is provided with a central entrance, from which access is gained to the borrowers' counter, which is upwards of 65 feet in length, and provided with the usual indicators. On the right, upon entering the entrance hall, will be found the general reading and newspaper-room, 57 feet by 42 feet, possessing not only cross-ventilation from Tavistock Road and Tavistock Place but also a certain amount of top-light. The room is also in direct communication with the lending library, and is thoroughly well supervised by the porter from his office. On the left-hand side of the hall will be found the lecture room, 41 feet by 30 feet, which faces Tavistock Road, and has an emergency exit direct to the street, the exit being also in touch with a lecturer's retiring-room, lavatory, &c. There is also a magazine-room, 39 feet square, amply lighted from Tavistock Place, as well as top-lighted. The lending library provides accommodation for 26,900 volumes and has a separate staff entrance, conveniently approached from Tavistock Place. A wide and ample stone staircase leads to the first floor, where will be found allocated the local collection room and reference library, the sizes being respectively 41 feet by 30 feet and 55 feet by 43 feet. One attendant can completely supervise both these rooms from a central counter. These rooms are lighted from both sides of the wall, through ventilation again being attained, and both are top-lighted. On this floor also is situated the librarian's room, 25 feet by 18 feet, with strong-room accommodation attached. It will be possible for the librarian to supervise a large amount of the lending

Imperial Buildings, Ludgate Circus, E.C. 4.

library and borrowers' counter downstairs by means of a bay window looking into the space below. The librarian has direct access from his room not only to the reference library, but also to the stack-room, where the main bulk of the books for the reference library are stored, as well as to the working portion of the library. The stack-room gives accommodation for 26,000 volumes, and in close connection with it will be found the catalogue-room, store and binding-rooms, the whole being connected with the ground floor by means of a special staff staircase. In the basement are the usual book stores, general stores, packing-room and reading cellar. The basement is connected with the rest of the building, both by means of a staff staircase as well as a book lift. A separate entrance is also provided for large packages of goods, &c.

The museum has a spacious entrance hall about 45 feet square. It is top-lighted, and has a gallery running round the four sides, from which it will be possible to look down into the hall. The gallery forms part of an arched arcade and forms an imposing feature in the design. There is an ample stone staircase at the further end of the hall, in direct view of the public entering the main entrance. On each side of the main entrance will be found cataloguing and cloak-rooms. On the ground floor are two imposing galleries, 80 feet by 30 feet, and over these picture galleries of a similar size, top-lighted. The museum galleries have ample windows provided in both walls. Provision has been made for two large galleries on each floor as regards future extension, and so arranged that the public will be able, when they are built, to traverse the rooms without crossing the main entrance. A staff staircase and goods entrance, with lift in connection therewith, are provided in Tavistock Place, and the work-rooms are in close connection with them. In the basement is a large lecture-hall, accommodating some 300 people, which can be approached from Tavistock Road, as far as the public are concerned, without entering the museum, and there is also an emergency exit in connection with the lecture-hall to Tavistock Place, which again can be utilised without traversing the museum entrance hall. A laboratory is in the basement for the curator's use. It is at the platform end of the lecture hall, and it will be available for science demonstrations, &c. As regards the elevation to Tavistock Road, it has been

felt desirable by the architects to carry both the museum and library through at one continuous level, so as to obtain the architectural composition asked for by the assessor in the instructions to the competitors. The acute slope of the street has, however, entailed the library windows being introduced at some different levels to those of the museum. It is at present proposed to face a large portion of the building with local limestone, the dressings and the mouldingwork generally being in Portland stone. The style of the architecture may perhaps be best described as a simple treatment of English Renaissance. The total cost of the scheme as submitted by the architects is 25,000*l.*, viz. 13,000*l.* for the library and 12,000*l.* for the museum and art gallery.

CORRESPONDENCE.

Window Cleaning at Hotels.

SIR,—The dangers which window cleaners run in working without efficient safeguards have unfortunately been again exemplified by a fatal accident at a London hotel. It is not difficult, however, to provide against accidents of this class. A strong leather belt to be worn by the window cleaner and provided with a life line, which can be attached temporarily to the top of a window opening, is all that is required. My own firm made a number of these for the London School Board, and have recently fitted 150 windows at Holborn Viaduct Chambers, for the Chatham and Dover Railway, with the necessary "eyes" to take the steel snap-hooks which are attached to the life line. The belt, &c., is sufficiently strong to hold a man if he slips off a sill, and, were some such inexpensive appliance in regular use, there would be no more accidents of the class referred to.—Yours faithfully,

J. C. MERRYWEATHER.

Whitehall Court, S.W. : January 30, 1907.

T-SQUARE CLUB.

THE Ladies' Night will be held on Tuesday, February 12, at the theatre of the Guildhall School of Music. An architectural play, "The Mystery of Marcus, or Antony and Cleopatra in a New Light," by Mr. T. H. Leverton, will be performed. Non-members can obtain tickets of Mr. Leverton, at 10 Lancaster Place, Strand.

ENGINEERING AND SCIENTIFIC ASSOCIATION.

THE opening meeting for the session 1907 of the Engineering and Scientific Association of Ireland was held on Monday evening in the College of Science. Sir Charles A. Cameron, C.B., president, occupied the chair, and delivered an address on a subject which was of great interest to architects and engineers from a public point of view—the necessity of securing their houses from the entrance to them of organisms which were so injurious to health. In former years very little was known, he said, compared with what they now knew of the deadly character of these things. An interposing layer consisting of asphalt should be laid between the foundation-walls and those above the surface of the ground. The atmosphere below the surface differed very much from that above ground. The President urged that pure air was as absolutely necessary as pure water if they wanted to keep enteric fever away from their residences. He described the ground on which the city of Dublin was built near the river. He said that the eighty-four houses erected by the Corporation were built with every consideration for the public health, and he had never heard of a case of enteric fever breaking out in any of those houses.

The following members were elected:—C. Howard Egan, electrical engineer; R. H. Hall, borough surveyor, Naas; R. H. Moynihan, engineer-in-charge, Dublin water-works; Kynan Quang, assistant electrical engineer.

BUILDING REGULATIONS IN EDINBURGH.

THE application by Mr. George Marr, solicitor, to deviate from the original plans for two tenements at Piersfield, was again considered by the Edinburgh Dean of Guild Court. Mr. Marr asked the Court to receive an amended plan, and that his proposals be agreed to. The Dean said he was sorry to say the petitioner had not accepted the situation. It would have been very much better to have done what the Court asked. The Court adhered to their former warrant, and the piers must come down and be built with stone on a proper foundation. Mr. Marr sub-

mitted that what they had brought forward was a substantial structure. He thought that as it stood at present the structure was perfectly substantial, as well as the foundations. They were willing, however, to improve the foundations to the extent indicated. He would ask that in the circumstances the matter be remitted to the burgh engineer so that they might arrange with him. The Dean intimated that the Court were not prepared to do that. Mr. Marr said he was not aware that the Court took upon themselves to prescribe materials. He had always considered it was sufficient for the Court that the materials were substantial. The Dean: We do not consider them substantial. I would point out to you that either you or the builder signed the plans before the warrant was granted on the condition that they were to be stone piers, and it was pointed out at the time that they were not strong enough, and we asked you to put in iron standards. You signed for that and ignored the whole thing, and put up brick piers. Mr. Marr said there was no record as to stone being required. The Dean: We have it on the plan. Mr. Marr thought it was hard on him that objections should be taken now to the foundations. He submitted that had the burgh engineer considered the objections valid he should have insisted at the time in having the matter put right.

THE directors of the First Garden City, Ltd.—the Hertfordshire enterprise—report that the success of the company generally has been most encouraging. The accounts show an apparent loss of 5,575*l.* on the year. No credit, however, has been taken for any increase in the value of the estate beyond the amount of the actual outlay upon it. The ground rents created during the same period amount to 1,110*l.*; these represent, at twenty-five years' purchase, a capital value of 27,750*l.* This shows an increase in the value of the part of the estate comprised in the leases largely exceeding the cost incurred by the company in respect of it, without taking into consideration the increased value of the rest of the company's land resulting from the growth which these lettings indicate.

PLUMBERS' REGISTRATION COMMITTEE.

As the result of the polling of the whole of the registered plumbers in the London District, Messrs. John Knight and C. Rogersou, master plumbers, and F. Randall and W. J. Jarvis, operative plumbers, have been elected members of the registration committee for London for the present year. The other members of the committee are Messrs. W. D. Caröe, M.A., F.S.A., master; Chas. Hudson, R. P. Warden; J. W. Hart, R.P., and Dr. F. J. Waldo, J.P., representing the Worshipful Company of Plumbers; Messrs. W. Fayers, J. Johnson, J. J. Rawlings and C. Thomerson, representing the London Society of Associated Master Plumbers; Messrs. F. Barter, G. H. Manser and F. R. Wyatt, representing the London management committee of the United Operative Plumbers' Association; Mr. W. H. M. Smeaton, representing the London Plumbers' Society; Mr. T. W. A. Hayward, A.M.Inst.C.E., representing the Incorporated Association of Municipal and County Engineers; Mr. H. D. Searles-Wood, F.R.I.B.A., representing the Royal Institute of British Architects, and Mr. W. Atkins, R.P., representing the Executive Council of the United Operative Plumbers' Association of Great Britain and Ireland.

LAND VALUES TAXATION.

THE following report of the Local Government, Records and Museums Committee (No. 2) of the London County Council on the separate valuation of land explains the policy it is proposed to adopt:—

We have had under consideration the report of the Select Committee of the House of Commons appointed to consider the Land Values Taxation, &c. (Scotland) Bill. The main object of the Bill was to levy a new and additional rate, not exceeding 2s. in the £, on the owners of land in burghs, the rate being fixed according to the yearly value (calculated at 4 per cent. on the capital value) of land apart from the buildings and erections upon it. The Select Committee heard a very large amount of evidence, and had before them, amongst other documents, the report of the Royal Commission on Local Taxation, and, although they were of opinion that the particular Bill referred to them should not be proceeded with, they stated their views at

length upon the principle involved. Briefly, the conclusions arrived at were that the new standard of rating based upon the yearly value of land, apart from the buildings and improvements upon it, is sound and would prove advantageous; that to set it up, by estimating the value of land apart from buildings, is practicable; and that in making the valuation regard must be had to all restrictions validly imposed on the land, and to recent expenditure in preparing it for use.

The report of the Select Committee is probably the most important document on the subject since the report on urban rating and site values made by five members of the Royal Commission on Local Taxation in 1901. The Select Committee agree with the views expressed in the report of 1901, that a land valuation is practicable; that the charge would be an equitable readjustment of local burdens; and that it would encourage building, facilitate industrial developments and tend to assist in solving the housing problem; and they consider that the advantages are not dependent upon the question as to what proportion ought to be contributed by persons interested in the property. The Select Committee, however, go much further in their report. The minority report of the Royal Commission above referred to recommended that a small rate, limited to expenditure tending to increase the value of urban land, should be imposed on site values; whereas the Select Committee rejected the Scotch Bill on the ground, *inter alia*, that land values are not taken as the sole basis of rating, and recommended the introduction of a measure making provision for the valuation of land, apart from the buildings and improvements upon it.

It appears to be not unlikely that legislation will be introduced on the lines recommended by the Select Committee. We are of opinion that such legislation should not be restricted to Scotland, but should be extended to England and Wales, and we propose that the Council should so inform His Majesty's Government. We have given instructions for copies of the report of the Select Committee to be sent to members, and we recommend the Council to pass the following resolutions:—“(a) That His Majesty's Government be informed that, in the opinion of the Council, any legislation which may be introduced to provide for a separate valuation of land, as recommended

THE WICK ESTATE, HOVE.

THE recent decision of the Hove Town Council to purchase St. Ann's Well and Wild Garden as a public park has been attended by immediate developments in the district, and an important scheme of road construction and house building on the Wick estate is now in progress. It embraces, says the *Sussex Daily News*, the construction of five new roads—one a continuation of Highdown Road westward to the bridge crossing the railway at Holland Road, with four roads leading from this in a north-easterly direction to the Old Shoreham Road. Hove residents know how remarkable has been the growth of property in the triangular piece of land between Montefiore Road and the Dyke Road, and how house-building is proceeding further westward between Montefiore Road and the Drive and on the southern side of Goldsmid Road. Then there is the new street being laid out between the railway and D'Avigdor Road. The latest scheme is, however, one of the most important of recent years.

Acting under the instructions of Mr. Mark Tucker (manager of the Wick estate), Messrs. Dudeney & Collings, of 74 St. James's Street, Brighton, have effected the sale by private treaty of about 14 acres of freehold land situate north of the railway line, and having frontages to Old Shoreham Road and Montefiore Road, and in conjunction with Messrs. Overton & Scott, of Ship Street, they have been appointed agents for the development scheme.

The new road westward from Highdown Road to the railway bridge is to be called Lyndhurst Road, and the four other roads running parallel with Montefiore Road to the Old Shoreham Road will be named Avondale Road, Glendale Road, Ferndale Road and Silverdale Road. In Lyndhurst Road plots will be laid out for about a hundred properties, some being reserved for the erection of shops. The frontages here will be about 18 feet per plot. The estate plans also provide for a frontage of 25 feet each for

fifteen good-class houses on the western side of Montefiore Road, while there are about twenty plots with 24-foot frontages, exclusively for private houses, on the Old Shoreham Road. For each of the other four roads running parallel with Montefiore Road, thirty-six frontages of 18 feet, suitable for the erection of small villas, are allowed for. The annual rental value of the proposed new properties will range from 35% to 55%.

The details incidental to the road-making are now well in hand, so that building operations may be commenced in the early spring. Messrs. Dudeney & Collings have already disposed of a number of the freehold plots, and they are in a position to offer other valuable frontages on reasonable terms.

THE SIZE OF CITIES.

THE general purposes committee of the Birmingham City Council are to consider and report whether, in their opinion, the time had arrived for a further extension of the city boundaries, especially in view of the fact that several outside local authorities were applying for incorporation. Mr. Chamberlain has been approached on the subject, and has replied, through his private secretary, as follows:—

"Mr. Chamberlain would not like to give a final answer to such a question without seeing the report of the general purposes committee and learning what arguments they have in favour of the course they may recommend. Personally he still retains the conviction that a population of more than 500,000 cannot be governed to the best advantage from one centre, but there may be circumstances which would force a larger organisation upon us, and the increase of all the suburbs of Birmingham may raise exceptional conditions which necessitate exceptional treatment. Mr. Chamberlain, however, does not think that, even if it should be shown to be necessary, that these outside districts should be brought under one common control, it will be to the advantage of Birmingham. On the contrary, it will probably add to the expense in proportion to population. On the other hand, the different outside areas are insufficient in size and population to justify their formation into

separate municipal bodies, so that the general purposes committee may think that the time has come when they can no longer avoid the responsibility of enlarging our municipal area. Subject, however, to their opinion on this point, Mr. Chamberlain would be inclined to hope that it may be found unnecessary to increase the present municipal area of the city."

DEFECTIVE CONCRETE CONSTRUCTION.*

WHEREVER failures occur it is generally cement that has to bear the blame. And on this material all the sins of omission or commission are heaped, and yet it should be noted that it is extremely rare that failures are traceable to the quality of the cement used. Where an unbiased examination is made the failure is generally found to be due to bad workmanship, improper design, insufficient strength and a too early removal of the forms for the construction of all of these, and many failures occur from improper material, insufficient mixing, improper consistency for effective tamping. In these days of machine mixing too little attention is given to the rigorous inspection of the process. As an illustration of this point I would state that on a large piece of work the system used in the mixing of the concrete was such that the sand was thrown in by one man, the crushed stone by another and the cement by a third; the latter being called away from his post failed to perform his part, but during the interval the sand and stone went in with rhythmic precision. It is obvious what the effect of these batches of concrete would be, and how fatally they would affect the strength of an important part of the structure. In another case which I have in mind the cement, sand and stone were fed automatically from hoppers so adjusted as to give the requisite proportion. At the time of this inspection the cement hopper had choked, but the sand and stone were flowing on and the operator, who was totally unaware of the fact, remarked, when his attention was called to it, that he thought the concrete looked rather peculiar. Perhaps the greatest source of failure is the strength of the forms; too little attention is given to the

* From the presidential address by Mr. R. L. Humphrey at the meeting of the National Association of Cement Users in Chicago.

design of these forms and they are often made entirely too light for even normal conditions, and where a temporary load in excess of that for which the structure was designed comes upon it the structure is either dangerously strained or collapses. I have in mind cases where excessive quantities of cement have been stored on the green concrete structure, and in one instance producing a collapse of the floor panel.

Concrete of improper quality is often used, and I recently saw in New York cinder concrete consisting of one part of cement and five parts of cinders going into a reinforced concrete structure. Again, the length of time which should elapse before the centring is removed has a marked bearing on the question of failures. The time required for concrete to harden sufficiently to permit the removal of the forms is naturally a variable one, depending on the design, the weather condition and the strength of the concrete. A concrete with a small percentage of cement will require a longer time to acquire the requisite strength than a richer mixture; it will also take concrete longer to harden in cold than in warm weather, and a beam of long span must be stronger than the one of short span before the form can be removed.

Another source of failure is the lack of attention to details, especially as regards connections in the erection of a structure. The structure may be properly designed with the requisite amount of steel, yet the structure may be fatally weakened by the character of the connections. A reinforced concrete structure should be practically a monolith—the tension members must be continuous in beams and columns. It makes a material difference as to the length of the splice allowed in such columns or whether the splice in continuous beams is adequate. I have in mind an instance which came to my notice of an enterprising labourer who, observing the rod in a column projecting out of the concrete in the column of a several storey building, seized a sledge hammer and drove the bar down flush with the surface of the concrete. The remedy for all this is inspection, most careful inspection.

No more unstable material is in use to-day than cement. From the moment it is reduced to an impalpable powder it undergoes changes which seriously affect its quality. Unlike steel, wood or similar materials, it does not stay tested

and its quality must be ascertained before use. When we consider the way in which so delicate a material is handled by unskilled labourers it is not surprising that failures should occur. A steel beam or channel is fabricated at the mill and undergoes during the process of manufacture a most rigid and careful inspection, and in the erection again undergoes careful inspection. On the other hand a concrete structure is fabricated on the site and is subject to little, or at the best indifferent, inspection, and the unintelligent labourer contributes to the abuse. The same careful and rigid inspection should be given the erection of a concrete structure as a steel structure receives, and until this is done we may expect failures.

The comparatively few failures in concrete structures are allowed to overshadow the great number of excellent examples of well-designed constructions of this class. And it should be noted that what failures there are occur during the process of erection, and are almost invariably due to a too early removal of the forms or bad workmanship. The failure of a structure of concrete by reason of improper design, bad workmanship or poor materials, no more affects the value of concrete for constructive purposes than the failure of a structure of steel due to similar conditions should condemn steel for structural purposes. We may expect failures as long as incompetent men will undertake to design structures in concrete and unskilled and ignorant persons will attempt to "skin" the work for the purpose of increasing their profits; and it will only be the continual loss of life that results from these failures that will bring the authorities to such a realisation of their responsibilities as will result in laws which will properly safeguard the public.

Amid the ignorance and wonder that attends the use of a new material the charlatan practises his art unchecked, new forms of patented construction are constantly springing into existence, many absolutely devoid of merit, and the public are being proportionately humbugged and deceived. Plans and specifications are generally prepared by the contractor, and for every skilled competent contractor there are many who are incompetent, who do not hesitate to skin the work in order that they may finish it without loss of profit, having taken it at a figure entirely too low to admit of proper workmanship with first-class materials. Such prac-

tices are wholly unnecessary, for first-class legitimate construction can successfully compete with other forms of construction, and there are many reliable concerns capable of executing such work.

Owners, architects and engineers are criminally responsible where they award work to irresponsible contractors lacking in the requisite experience and knowledge for safe construction, or who permit structures to be erected under the direction of competent persons who do not give the work their personal supervision. Where the charlatan reaps his greatest harvest is through the medium of the beguiling literature giving strength values based on tests primarily made for the purpose of developing and exploiting the strongest features of the system for which he holds the patent. Many concerns rush in with inadequate experience, acquiring this at the expense of their clients.

IRISH COTTAGES.*

ONE once went in for a competition. It was not a very celebrated competition, nor were the premiums large—they ran, if memory serves aright, from 20*l.* to 50*l.*—no great inducement even in these strenuous times. One thought, however, that the "kudos" resulting from success might be great, and so competed.

Unfortunately, between twelve hundred and two thousand architects, engineers, builders, plumbers and private individuals thought similarly, and applied for the conditions. Most of these were from Ireland, but a goodly sprinkling were from England, Wales and Scotland, while it is rumoured one man wrote from South Africa. Things must be in a sad way out there.

As to how many of the two thousand actually started preparing plans one has no accurate information—probably from five hundred to seven hundred—but it is reported that eight hundred sets of drawings were sent in by 386 competitors, representing approximately the same number of bosoms inflated with hope, and as the result is not yet

* A paper on the competition instituted by the Local Government Board, read at the Designs Club of the Architectural Association of Ireland, and printed in the *Irish Builder and Engineer*.

noised abroad, it is probable that 385 of these bosoms are still inflated with hope, which has long since died in one's own—squashed out with the dead weight of long odds.

Doubtless you will by now have guessed the competition referred to; some may even have been sanguine enough to have entered, and be reckoned among the 385 hoppers; if that is so one has no desire to become a wet blanket, but a cursory review of the conditions laid down may provoke an instructive discussion.

Roughly speaking, one was asked to provide and fix at a cost of 130*l.* a one or two-storey cottage, complete in all details, with a living-room containing 1,200 feet of fresh air, and three bedrooms, one containing 900 and the other two containing 600 cubic feet of the same commodity. Moreover, this cottage was to be well and truly built with external walls not less than 10 inches thick, dashed or plastered, thereby ordaining that concrete, that delightfully cheap material, if employed, should be cement plastered externally.

Brickwork was obviously out of the question, therefore one's choice lay between masonry and concrete. One consulted many people—builders and brother professionals—and much advice was the result, mostly of a contradictory nature.

Masonry, of course, had the merit of being the more familiar material to country builders, while concrete could be produced at a very low price by the liberal employment of displacers, to which, surely, much objection cannot be raised, provided always the cement is good. "Displacers at suitable intervals approved by the architect." Heaven help the architect who has to stand by and point out how frequently the displacers may be displayed; but such presumably would be the specification phraseology, if the term can be excused.

But then, even with displacers, one had to superadd the wretched cement plaster, bringing the cost at least up to, if not over, the price of masonry, and so one tossed up, and concrete won.

This question settled, one prepared typewritten schedules, and distributed them among one's country builder friends. Sketches, too, of stairs and so forth were attached, and these were returned in due course conscientiously priced.

One's most particular friend (a notorious price-cutter) was requested to furnish detailed estimates for both one's designs, a one storey and a double-decker.

Those schedules were interesting reading. One learned from them that, whereas ordinary excavation in co. Dublin costs 1*s.* 6*d.*, in co. Kildare it costs 1*s.*, and in co. Cork 8*d.* Concrete, on the other hand, in co. Dublin (with profuse displacers) can be brought down as low as 14*s.* per yard, while in co. Cork the lowest cut appears to be 17*s.*—this is for foundations. In the matter of rising walls (6-1) concrete in Dublin appeared to cost 16*s.*, while in Cork it jumped to 26*s.*

Lead laid in co. Dublin seemed to be worth about 35*s.* per cwt., while it can be laid in Kildare for 30*s.* A simple staircase (about fourteen risers) costing in Dublin 8*l.* 10*s.*, can be built in Cork for 4*l.* every time. It seemed obvious from the first that a 130*l.* cottage could not be fully plastered inside; one, therefore, asked for a price for rendering only, finished smooth with a hand-float; this in Dublin costs 1*s.* 6*d.* per yard, but a Kildare man will do it as often as one likes for 7*d.* The variation in cost of roofing complete with American slates was almost as great, amounting to 1*l.* per square. But someone may say, "These builders were fools and knew not their honourable trade." To such an one I would say they were men of large experience, and well known in their own districts, and, moreover, with the exception of he who is referred to as "one's most particular friend," they did not know for what purpose they were pricing the schedules—thinking, doubtless, that some vast scheme was afoot, from which, in the days to come, they would reap large emoluments. In due course the most particular builder friend arrived with his estimates—they were very complete, and he had stuck to his schedule as closely as a brother sticks, but alas! the one-storey edifice worked out about 150*l.*, and the two-storey at 168*l.* Consternation was on top for a little—the Local Government Board competition was an impossibility unless drastic measures were adopted. To reduce the size of the buildings was impossible—firstly, because the drawings were already completed, and, secondly, because six inches off any dimension would reduce the cubing below the stated level.

It seemed the only course one could adopt was to cull

the honey from every flower, and price at the lowest rate quoted for each material, irrespective of locality. This course had the merit that it could truthfully be asserted that one's prices were those in vogue in localities with which one was familiar—one of the Local Government Board conditions.

By pricing at the lowest rates picked from all three schedules, now known as "the honey system," a substantial reduction was effected, and the price of the cottages, if well and truly built in the Utopian county thus arrived at; but then, horror of horrors, the outbuilding had not been included, so once again the fat was in the fire.

Some judicious pruning in the thickness of concrete and other floors, in the size of sashes and doors, in the dimensions of chimney-breasts, foundations and so forth, brought the external conveniences into the fold, and then one's only labour was to fill in the forms and write a short specification.

So much for the competition; but it behoves us to look at the conclusions to which one is forced. Unquestionably the cottages asked for were much too large for the figure stated. The apartments were unnecessarily big, and there was one room too many. It seems impossible to design a cottage with the room capacity required with a total cubing of less than about 7,000 cubic feet. This, divided into 130%, works out at about 4½d. per cubic foot, a price at which no permanent and habitable dwelling-house can be erected with good materials. Besides, when estimating cost by cubing, one does not as a rule include grates and sanitary arrangements, even though the latter take the form of the homely bucket.

But the Local Government Board cottage at 130% had to include all these things and a small range to boot, or, if in a turf country, an open hearth with fire-bars and hobs which must be formed with some fire-resisting material. One cannot help thinking that the Irish farm labourer, that delightful individual of whom one hears so much and sees so little, should be able to content himself, and, incidentally, his wife and offspring, in a cottage of three rooms—two bedrooms and a living-room.

We all know the old familiar plan—wall and chimney-breast in the middle living room, right-hand side as one enters the tiny porch, and two bedrooms to the left. If

it has worked so well in the past, why shouldn't it work again? and if very carefully designed and arranged with the most economical materials, it might be produced for 130%. If, on the other hand, cottages must be erected for that figure containing four rooms, and the Local Government Board allowance of 3,300 cubic feet, the only solution is mud—this sounds prosaic, but so says an eminent Dublin architect who has taken a great interest in this threadbare but ever recurring subject.

Admittedly, mud on one's clothes, and to road users, is offensive, but mud in the walls of a cottage has merits. The mud cottage is familiar to us all—it has stood the test of time, and when unroofed its walls have bravely weathered a score of winters, which would have reduced its masonry rival in similar plight to a pile of uninteresting stones.

Consider for a moment its demerits. The examples of mud-built cottages one sees suffer principally from lack of light and ventilation, and, perhaps, a somewhat tumbled-down hearth.

Surely these defects are easily overcome, the first by the fitting of ample windows and the latter by building the hearth with brickwork.

This and a concrete and tiled floor, together with the joinery, are the only skilled works in the establishment, for surely a labourer, with the help of technical education, can puddle clay.

The roof would, of course, be thatched with rough fir rafters, and fir ties could be embedded in the mud at the angles of walls to bind them together.

Internal partitions would be lathed and rendered smooth, and all walls inside and out lime-whitened. From an æsthetic point of view, there is no doubt as to which material scores—the cry goes up, "the muds have it every time"—the massive walls slightly battered (I refer to their plumbing, of course), the golden thatch with neatly trimmed eaves, the creepers peeping in at the ample windows, and the much-maligned mud cottage becomes part of the landscape at the low cut of 130% each, and everyone, including the Local Government Board, is satisfied.

N.B.—Since writing the above the award has been published, and has fully justified the death of hope in the heart of the author.

CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up the sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead-air spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

* * * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

CASTLEFORD.—March 3.—The Governors of Castleford Secondary schools invite designs from architects practising in the West Riding of Yorkshire for a dual Secondary school, &c., for 300 scholars. Premiums of 50% and 25% to be awarded by Mr. W. H. Brierly, the assessor. Deposit 10s. 6d. Mr. A. Wilson, clerk to the Governors, Station Road, Castleford.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20% and 10% will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

SALFORD.—Feb. 16.—Architects are invited to submit their names for appointment as architect for the erection of public baths. Only those with previous experience will be entertained. A limited number will be selected by the committee for competition. Further particulars of Mr. L. C. Evans, Town Clerk, Salford.

SUNDERLAND.—March 30.—New church and halls for the Presbyterian Church of England in the Side Cliff Road, Roker, Sunderland. Premiums of 25% and 15% respectively. Lithographed plans of site, &c., on application to Mr. George W. Bain, 46 John Street, Sunderland.

CONTRACTS OPEN.

ACCRINGTON.—Feb. 11.—For the work in connection with proposed alterations to the post office and Dr. Craig's house at the corner of Blackburn Road and Market Street, Church. Mr. A. H. Aitken, town clerk, Town Hall, Accrington.

BAILDON.—Feb. 13.—For the erection of a pair of semi-detached houses on the Park Mount Estate, Kirklands Road, Baildon, Yorks. Mr. J. Harper Bakes, architect and surveyor, Calverley Chambers, Victoria Square, Leeds.

WEST KIRBY (CHESHIRE).—Feb. 18.—For the erection of a new school at West Kirby, for the administrative sub-committee for the Hoylake and West Kirby district. Mr. H. Beswick, county architect, Newgate Street, Chester.

WEYMOUTH.—Feb. 13.—For erecting business premises in St. Leonard's Road, Weymouth. Mr. S. Jackson, M.S.A., architect and surveyor, Bridge Chambers, Weymouth.

WEYMOUTH.—Feb. 13.—For the construction of public conveniences, partly under and partly above ground, in the Greenhill Gardens, with the necessary sewers, inspection chambers, &c., and other works in connection therewith, for the Town Council. Mr. H. A. Huxtable, town clerk, Municipal Buildings, Weymouth.

WIGAN.—Feb. 11.—For extension of boiler-house, engine house and other works at the Corporation electric generating station, Bradford Place, Wigan, for the Corporation. Mr. Harold Jevons, town clerk, Wigan.

At the annual meeting of the Master Masons' Association of Glasgow and neighbourhood in the Building Trades Exchange, the following office-bearers for 1907 were elected, namely:—President, Mr. George Barlas; vice-president, Mr. William M'Neil; treasurer, Mr. Robert Gilchrist. The following are the directors for 1907:—Messrs. Allan Muir, John Adam, Moses Barlas, Ebenezer M'Morran, George Sharp, Duncan Wilson, Alexander M'Lellan, Matthew Penman, Adam Duncan, John M'Ewan, John Kirkwood and J. B. M'Callum, with a representative from each of the Paisley Master Masons' Association in Airdrie and Coatbridge Master Masons' Association. Mr. William Sellar, of Sellar & Christie, 116 Hope Street, Glasgow, was appointed secretary.

Mr. P. M. CROSTHWAITE, C.E., inspector on behalf of the Local Government Board, held an inquiry recently in Surbiton Council Chamber into the application for sanction to a loan of 66,000*l*. for the purposes of a scheme of drainage and sewerage for the whole Surbiton district. Considerable interest was taken in the proceedings. The proposed works were on the highest form of sewage treatment within the Board required. The area taken—near Ewell, but still within the Surbiton boundary—was 32 acres. The promoters proposed to prevent any flooding by carrying a relief sewer from a point on the Hogg's Mill stream opposite Kingston to a point on the river Thames opposite Ram's Ait. An arrangement was come to by Surbiton and Kingston Corporation, the Thames Conservancy and the owner of the water-cress beds on Hogg's Mill stream, by which all are satisfied. The extra cost to Surbiton to increase the loan required to 71,000*l*.

MESSRS. BRINDLEY & FOSTER, organ builders, of Sheffield have received the order for two large organs, both to electrically blown. One is for the East Ham (Weyleya Great Central Hall, and the other for St. John's Church Preston Park, Brighton.

MESSRS. GEORGE MILLS & Co., of Radcliffe, the proprietors of the Mills' modified "Titan" sprinkler, have received the following letter relating to the action of the sprinkler in the case of a fire which broke out in a wo stores:—"February 2, 1907.—From Glenpark Wool Floor Co., Flock Manufacturers, 200 Glenpark Road (off East Nelson Street), Glasgow.—Dear Sirs,—On the 24th ult. a fire took place in the curling-house of our premises, where large quantity of baled and loose flock was in course of preparation. The nature of the material caused the fire to spread with great rapidity, but we are very pleased to state notwithstanding the frosty weather which prevailed, the sprinklers operated so quickly and successfully that the fire was completely overcome before the arrival of the fire brigade.—Yours faithfully, for Glenpark Wool Floor Co., (Signed) ARCHD. CLARK, proprietor."

THE Danish Government propose to enlarge the harbour of Esbjerg at the expense of the State. A Bill has been introduced into the Folkething providing for the expenditure of 227,500*l.* on the commercial harbour and of a sum not exceeding 81,110*l.* on the fishing harbour. It is proposed to deepen the harbour to 24 feet, so that it will be practicable for large steamers.

ELECTRIC NOTES.

SIR ALBERT K. ROLLIT will act for the Oxford Tramway Company, and Mr James Swinburne, Victoria Street, Westminster, consulting engineer, for the National Electric Construction Company, in the arbitration to decide the amount to be paid for the Oxford tramway system. If the arbitrators fail to come to an agreement an umpire will be called in, the arbitrators themselves nominating him.

Mr. V. A. H. M'COWEN, electrical engineer to the Corporation of Belfast, has just been appointed to a similar position for the borough of Salford at a salary of 800*l.*, rising by annual increments of 100*l.* to 1,000*l.* Mr. M'Cowen went to Belfast in 1894, and the municipal electrical undertaking was inaugurated and has been carried out under his supervision, as well as a good deal of important work in connection with the recent electrification of the city tramways.

A DEPUTATION from Failsworth Urban District Council attended a meeting of the electricity committee of the Manchester Corporation recently asking for a supply of electricity to that district. It was stated that the committee had inquired into the matter and failed to get a sufficient guarantee to justify them in incurring the expense of laying down the mains. For that reason the matter was deferred until there was a bigger demand or until such time as the supply could be put in more cheaply.

The electrical undertakings in London have started their own journal, the *Electrical Bulletin*, published quarterly. The copy before us is a bright little production, smartly

written, and very naturally strongly urges the claims of electric lighting and heating as against any other form, but as gas is undoubtedly the enemy to be contended with, the *Electrical Bulletin* is very jubilant about gas failures. Each serves its purpose, both gas and electricity, and each has its failures, as all architects know oftentimes to their cost, and neither side has any right to be over-jubilant on that score.

A NEW system of electric lighting for trains has been devised by Mr. J. Dalziel, of the Midland Railway Company's electrical department at Derby, and the company are experimenting with it. The regulation adopted, according to the *Manchester Guardian*, involves the use of three small machines, all of which have their armatures mounted on one shaft, which is independent of the armature of the main machine. One battery only is necessary, and this is required for supplying current when the train is standing or running at a speed below that at which the dynamo comes into action. The regulation of the lights is quite independent of the battery, which can be disconnected from the dynamo at any speed without interfering with the pressure on the lamps. The regulation is thus entirely electrical, compensation for speed variation or difference in load being made by the small regulating machines. It is claimed that in this system the battery is subject to much less severe usage, and that its capacity can be much smaller than in certain other systems, while the energy consumed by it is very low. The regulation is said to be as good at ninety miles an hour as at twenty, as the apparatus contains neither mechanical governors nor slipping belts.

VARIETIES.

PLANS have been prepared for a new Presbyterian chapel, school, lecture hall, &c., to be erected at the junction of King Street and Rhosddu Road, Wrexham. The total cost will be about 5,000*l.*

THE Manchester sanitary committee have decided to ask Dr. Niven, the medical officer of health, to attend the Brussels International Conference to be held in September in connection with the protection of child life. It was

further agreed to appoint a deputation to visit Glasgow for the purpose of inspecting the lodging-houses there.

THE South-Eastern and Chatham Railway Company, whose system forms the direct route between London and the beautiful watering-places on the Kent and Sussex coasts, with cheap fares, fast trains and special week-end facilities, have issued four sets in colour of pictorial post-cards admirably illustrating the trains, stations, locomotives and steamers respectively.

DURING December the Metropolitan Water Board supplied 1,058,000 houses with a daily average of 209,503,000 gallons of water, and the population supplied was estimated at 6,872,768. The supply works out at 30.4 gallons per head per day, compared with 29.9 in the corresponding period last year. At the end of the month there were 7,164,000,000 gallons in store in impounding reservoirs, compared with 6,150,000,000 gallons last year.

THE top stone of the tower of the Stockport town hall was laid last week, and the structural part of the building completed. The foundation-stone was laid on October 15, 1903. It was originally estimated that the cost of the building would be 66,000*l.*, but the actual expenditure will be close upon 100,000*l.* This will involve a rate of 3*d.* in the pound for the town hall. Sir A. Brumwell Thomas is the architect.

THE Blackpool Corporation, on account of the lowering of the foreshore opposite the Blackpool Promenade at North Shore, have had some anxiety as to the safety of the Promenade works, as recent storms have shown that there is some danger of the "toe" of the slope in front of the sea wall being undermined. The highways committee have had the matter under consideration and have now decided that 3,000*l.* be spent in putting in a new "toe" and strengthening the sea defence works.

H.M. CONSUL-GENERAL at Antwerp (Sir C. Hertslet) is informed by the British Vice-Consul at Charleroi that a syndicate was recently formed in that town for the sale of window-glass ("fourths") to China. The syndicate, which all the window-glass makers have joined, is known by the name of Le Comptoir des Ventes des Verres à vitres pour la China." The Consul-General observes that only a somewhat inferior quality of glass is sold for shipment to China,

and that there is no immediate prospect of a syndicate being formed for the sale of all qualities and specialties of glass, the difficulties being too great to permit an agreement between the various manufacturers.

THE annual general meeting of the Master Builders' Association of Ireland was held in Dublin recently, when the following officers and committee were appointed for 1907:—President, Mr. James Beckett; vice-president, R. Denne Bolton; committee, Mr. James Kiernan, Mr. H. M'Laughlin, Mr. G. Goodfellow, Mr. H. Pemberton, Mr. B. W. Whyte, Mr. Thomas Conolly, Mr. James Martin; hon. treasurer, Mr. Samuel Roberts; hon. secretary, Mr. John Good, 55 Great Brunswick Street.

THE result of the poll of the burgesses of Tunbridge Wells on the proposal of the Corporation to promote a Bill in Parliament for the compulsory acquisition from the Lord of the Manor of the mineral springs and properties on the Pantiles at an estimated cost of 50,000*l.* was made known last week. The ratepayers have decided by seven to one in a poll of 4,000 against the proposal. The result was practically a foregone conclusion, popular opposition to the Bill being very pronounced.

THE Leeds Corporation proposed to promote a Bill in Parliament for waterworks purposes, and for a new scheme for sewage disposal on part of the Temple Newsam estate. The sewage scheme was opposed chiefly because of the proposal to pay 231,000*l.* for the land, which was considered to be an exorbitant sum, and a poll was demanded, which took place on the 31st ult. The result was that 4,751 ratepayers voted against the resolution, and 1,772 in its favour. There was thus a majority of 2,979 against the resolution, and the portion of the Bill referring to the sewage scheme is therefore withdrawn. There are over 70,000 ratepayers, but only 6,523 recorded their votes.

At the annual meeting of the Belfast Builders' Association the report submitted by the committee stated that there was no general improvement in the state of the building trade, but the marked improvement in the staple and other trades in the city should give an impetus to the building trade, and is a reasonable indication of more prosperity therein in the near future. The prices of building materials still show an upward tendency, but while the present unfavourable conditions continue the committee regret that

keen competition for contracts is leading to under-estimating prices and risks, detrimental alike to the successful competitor as well as to the whole building trade. Labour continues in excess of the requirements, consequently the prevailing rate of wages and the regulations affecting labour have not been disturbed.

MR. WILLARD D. STRAIGHT, the United States Consul-General at Mukden, in a communication to the Washington Bureau of Manufactures, says it is reported in the Japanese press that plans have already been completed for the construction of a large steel bridge across the Yalu river, between Antung and New Wiju, and that the work will be commenced some time during April. The length of the bridge will be 3,239 feet, and the cost of construction more than 200,000/. Until the doubling of the Seoul-Wiju and Antung-Mukden lines it is proposed to use only one side of the bridge for railway purposes, the other side to be converted into a public thoroughfare. Large piers will be erected at intervals of from 200 feet to 300 feet, and their height, about 40 feet, will be such as to avoid any obstruction of river traffic.

THE special committee of the Manchester Corporation appointed to consider the question of sewer ventilation has reported on a number of experiments made by various firms for subsequent use in ventilating the Manchester sewers. They do not recommend the adoption of any of the methods, but suggest that a station be provided where bacteriological and chemical observations of a serial and continuous character can be carried out with the precautions necessary to insure accuracy, and Professor Delépine considers that the laboratory grounds which run along High Street and York Place might, at a small cost, be made the point of observation by connecting the sewers in those streets with the laboratory grounds by side entrances. If this were done the results obtained at the end of one year's regular observations would, it is thought, fully justify the expenditure of time. There is at present nothing absolutely clear as to the influence of sewer air upon health, the sources of variations in the contents of sewer air, or the nature of the oxidisable gaseous organic matter said to give to sewer air noxious properties. These and other matters could be determined by the systematic work now suggested.

EMPLOYERS' LIABILITY.

THE recent extension of the Employers' Liability Act has caused consternation in the majority of households. Care will have to be taken in making provision for all the contingencies which apparently can be sanctioned. Preference should be given to offices which have had experience in meeting similar risks.

The Law Guarantee and Trust Society, Ltd., having decided to extend the scope of its transactions, has recently acquired the United Legal Indemnity Insurance Society, Ltd., with a substantial premium income and large agency organisation. The United Legal transacts the following classes of insurance business:—(1) Employers' liability insurance, (2) third-party risks of all kinds, (3) motor-car insurance, (4) personal accident and sickness insurance, (5) plate-glass insurance, (6) burglary, housebreaking and larceny insurance, (7) registered post insurance.

The policies of the United Legal are all up to date, and reasonable premiums are charged. No one intending to insure under any of the above-mentioned headings should make up his mind without inquiring of the United Legal Society, all of whose policies are guaranteed by the Law Guarantee and Trust Society, Ltd., which has a fully subscribed capital held by wealthy shareholders of 2,000,000/., of which 200,000/., is paid up, and also a general reserve fund of 200,000/., in addition to other funds earmarked to provide for various contingencies. This guarantee makes the financial status of the United Legal very strong—placing it, in fact, in the front rank of its competitors.

Special attention will be paid to employers' liability insurance business, and a liberal policy protecting householders, landowners and others against legal liabilities under the Workmen's Compensation Act, 1906, is in preparation, and also another policy by which the assured, in addition to having this protection, will be in a position to recompense a servant in the event of his or her meeting with an accident which does not come under the Act. The premium for the former will be 3s. for each indoor servant, and for the latter policy 5s., but rather more will be charged for outdoor servants. Under the auspices of that well-known wealthy and progressive company the Law Guarantee and Trust Society, Ltd., the United Legal should obtain a large share of all classes of business for which it competes.

FEW Words About "ETERNIT" SLATES AND TILES, the Modern Roofing Material. Superseding Welsh Slates and Tiles. Our Artificial Slate combines artistic appearance with indestructibility, and therefore represents the most economic, high-class fire, frost, acid, and weather-resisting roofing. Roofs covered in accordance with our instructions require no repairs for at least 20 years, and if intact then the presumption is that they will remain so for generations. As supplied to the Admiralty, War Office, Crown Agents for the Colonies, Board of Works, etc. Colours: Terra Cotta, Granite Grey and Blue. 66½" lighter weight than Bangor Slates, and 60% stronger. ETERNIT SHEETS, 8ft. by 4ft., cheapest and strongest fire-resisting material for lining Walls and Ceilings: Asbestos, with minimum binding matter.

Write for full particulars to G. R. SPEAKER & CO., 29 Mincing Lane, LONDON, E.C. (Telegrams: "Etrasheet"); and at 57 Hope Street, Glasgow, and 33 Victoria Street, Bristol; or to the DARLINGTON CONSTRUCTION CO., Bank Top, DARLINGTON.

AIDS TO NATIONAL DEFENCE.

The spirit of the time is suggested when it is found that constructional engineers having the standing of Messrs. Ralston, Goodwin & Co., of Glasgow, are applying their inventive powers to targets and other apparatus calculated to aid in making efficient soldiers. It is in its way as surprising as the creation of a rifle club among the members of the Architectural Association. The old-fashioned target resembled the old manner of fighting: it was mass against mass. But the patent targets of Messrs. Ralston, Goodwin & Co. are ingenious mechanical contrivances which exemplify dynamics rather than statics. They possess motion, and resemble an enemy who can find shelter as quickly as they fire. Yet the arrangement by which the targets are made to change their positions is simple and can be worked by men who are not trained mechanics. Fixed targets are an absurdity, for in modern war there is no likelihood of encountering troops who, like the French Household Guards at Fontenoy, will stand still and ask the English to do them the honour of firing at them. Among movable targets we have not seen any which have the advantages of the Ralston system. The firm also construct drill halls, range pavilions and much else for volunteer and army training. As iron roof and bridge builders they have special advantages for such extra work.

SITE PLANNING.

A COMPETITION for site planning in connection with the National Housing Reform Council was lately arranged. Nineteen designs were submitted. The judges were Mr. G. T. Brown and Mr. J. Walton Taylor, architects, with Messrs. Stephen Easton, F. H. Holford and W. Sewell. The awards were as follows:—

Gold Medal.—Messrs. Watson & Scott, Newcastle-upon-Tyne.

Silver Medal.—T. Myddelton Shallcross, Liverpool.

Bronze Medal.—Messrs. Watson & Scott, Newcastle-upon-Tyne.

The roads upon the design which obtained the gold medal have a total length of 3,540 feet, as follows:—
Road A, 202 feet; road B, 60 feet; road C, 913 feet;

road D, 865 feet; road E, 792 feet; road F, 708 feet; total 3,540 feet.

FIRE-RISKS

MINIMISED BY USING

PATERSON'S

FIREPROOF ELECTRIC CABLES AND WIRES

These Cables are highly fire-resisting and tend to subdue any burning mass without, and any are flame within, the insulation. Specially suitable when wiring HOSPITALS, INSTITUTIONS, PUBLIC BUILDINGS, THEATRES, PRIVATE HOUSES, &c. The following testimonial from one of the largest Corporations in the British Isles is **SURELY CONCLUSIVE**:—

"I have tested the samples of Fire-proof Cable which you have forwarded to me, and I find that **their fire-resisting qualities are satisfactory**, I have therefore pleasure in enclosing order for the cable required."

MAKERS OF PALMER'S ELECTRICAL CLOCKS,
THE SIMPLEST AND MOST RELIABLE ON THE
MARKET.—Full Particulars on Application.

Their total area is 3½ acres, the net area of the sites being 13½ acres. Except for the purpose of further opening out the lands on the west belonging to the Corporation,

road "B" is superfluous. It is deemed essential to avoid the formality of houses built in straight lines, and the roads here shown by varying the depths of the sites from front to back also provide for the separate classes of houses proposed to be built. These are thought to be better intermixed rather than built in separate groups. The roads as shown, consistent with economical development, give ready access between the different portions of the ground. This treatment also gives better views from within the houses as well as without. In conformity with the slope of the land the sewerage will have to be taken from north to south, down roads "C," "D" and "E," to Shields Road. A site for the exhibition building is reserved abutting upon the highway, and upon this part of the land, when a community has become settled upon the place, shops could with advantage be erected.

The length and widths of roads in the second design are as follows :—

Yards.	Widths.	Schedule.
310 lineal	63 feet	Road A, 310 yards
1,026 „	40 „	„ B, 332 „
		„ C, 379 „
		„ D, 128 „
		„ E, 187 „

In the construction of roads it is suggested that "Taafalt" or some other suitable dustless material should be used instead of the ordinary macadamised surface, and that the footpaths should have a gravel-finished surface with a strip of York stone flag (or cement manufactured flag), of less width than the complete footpath, laid down the centre thereof. The planting of trees on each side of the roads is indicated upon the drawing.

The awards in the site planning competition for the Sheffield competition have been made by the judges, and are as follows :—

Gold Medal.—Messrs. W. Alex. Harvey and Arthur McKewan, of Birmingham.

Silver Medal.—Messrs. Currey & Thompson, Derby.

Bronze Medal.—Mr. Claude Batley, Kettering and London.

There were twenty-six designs in all submitted.

THE "MANCHESTER" SASH-HOLDER.

THERE are few householders who have not had the paint on their windows damaged, and who have not been put to considerable expense in replacing broken sash cords. The beads are nailed to the sash frames, and can only be taken off by the use of force, which necessitates the employment of a skilled carpenter, and often causes damage to the woodwork. To obviate these inconveniences there has recently been introduced the "Manchester" patent sash-cord holder, by the aid of which a broken cord can be removed and a new cord inserted without taking off the beads or removing the sash. The operation can therefore be done by any handy man, or even by the householder himself. To enable a new sash cord to be easily fixed in a window it is, of course, necessary that both ends of the cord should be readily accessible. One of these is attached to the sash, and the other to the sash weight, which has fallen to the bottom of the pocket in which it slides. To enable them both to be got at, the portion of the parting bead crossing the pocket piece, in the method of construction we are about to describe, is cut and fastened to it. This pocket piece is undercut in the usual way at the top, and fixed with a small screw at the bottom. A novel means of securing the other end of the cord to the sash has been devised, and is illustrated in the annexed engravings. By reference to these it will be seen that the cord lies in the usual groove in the side of the sash, but that instead of being nailed into position, the end of it is secured by the grub screw c in a small brass holder or block, which can be slipped into place and then secured by the screw A, the head of which lies in a brass cup near the glass, and is readily accessible.

The method of operation of removing a broken cord and replacing it by a new one is as follows:—The sash is raised to expose the pocket piece, which is taken out. The sash weight is then lifted out of the pocket, together with the piece of cord attached to it. Next the screw A is withdrawn and the block B lifted out of the groove by the remaining piece of broken cord, which is then withdrawn from the block. The new cord is then reeved round the pulley in the sash frame and tied to the weight, which is put into the pocket, and the opening is then closed. The

block B is then put on to the other end of the cord, and the screw c forced home until it pinches the cord tight and also forces a portion into the countersink at the opposite side of the block. It is then easy to lower the block into the groove in the sash, as shown in the engraving, and to secure it by the screw A, and the work is complete. In old

work these alterations can be made either when a cord breaks or when the window frames are about to be repainted. Once the new fittings, which are being introduced by Mr. W. H. Southern, of 38 King Street West, Manchester, have been applied to a window, there will be no further need to take it to pieces again.

THE HIGHEST CHIMNEY IN THE WORLD.

THE Alphons Custodis Chimney Construction Company, of New York, which is associated with the English company of the same name, whose offices are at 119 Victoria Street, Westminster, S.W., has just received a contract to build the tallest chimney in the world—in fact, the tallest structure of any sort save the Eiffel Tower and the Washington Monument—from the Boston and Montana Consolidated Copper and Silver Mining Company at Great Falls, Mont. The chimney will rise 506 feet above the top of the foundation and will have an internal diameter at the top of 50 feet. The size of the chimney has been stipulated to lead off 4,000,000 cubic feet of gases per minute, with a maximum temperature of 600 degs. Fahr. The gases consist mainly of SO₂ from the smelter furnaces, and will travel 2,000 feet through flue ducts before reaching the chimney. The chimney is designed so that an additional 60 feet may be put on at any time in case more draught is desired.

The point where the chimney is to be built is 3,535 feet above the sea-level, and on account of the exposed location and the strong gales in Montana, the stack has been designed to withstand a gale of 125 miles per hour velocity. Assuming a unit weight of 116 lbs. per cubic foot of brickwork, the maximum pressure at the foot of the chimney, due to the dead weight and the wind pressure, is computed at 21 tons per square foot. There will be four flue openings in the bottom of the chimney, each flue having 528 square feet of area.

The entire chimney is to be lined with Custodis sectional lining, laid in acid-proof mortar. The present common brick chimney at the smelter, which is 186 feet high by 20 feet diameter, has cracked very badly on account of the influence of the SO₂ gases on the cement mortar. In designing this new chimney special care has been taken to resist the influence of the sulphuric acid gases. The sectional lining will consist of a 4 inch acid-proof brick laid in acid-proof mortar and separated from the main wall by an air space of 2 inches. To prevent the flue dust from settling behind this lining, special form bricks will be employed and all spaces at the top of each section of lining, through which the dust might find its way, will be closed

with mineral wool. The top of the chimney will be protected by a terra-cotta cap with overlapping edges, laid in acid-proof mortar. As the heavy gases will fall in rainy weather alongside of the chimney, the upper part of the outside brickwork will be pointed up with acid-proof mortar, and the outside ladder and lightning-rod will be protected against the influence of the acids.

The foundation will rest on rock and consist of circular concrete walls 30 feet in height, with an outside diameter at the bottom of 90 feet. The pressure produced on the rock due to the dead weight and wind pressure is computed at 7 tons per square foot.

The total dead weight of the chimney is estimated at 17,000 tons, and if common brick were employed, it would require about 6,000,000 bricks to build the chimney.

To scaffold this chimney from the inside will be quite a feature, and four elevators run by electrical power will be employed to carry up men and material.

A new brickyard will be built especially for the purpose of manufacturing the required perforated radial brick, and the plant will be constructed so as to obtain an output of 100 tons per day. The entire brick plant will be run by electrical power derived from the waterfalls of the Missouri river. An aerial tramway will be constructed to transport the material from the brickyard to the chimney, as the brickyard will be at a much lower elevation than the stack.

The Custodis Company expect to finish the chimney in about one year's time. The contract price for the chimney, without foundation, is in the neighbourhood of 200,000 dols.

The tallest chimney in the world at present is the 460-feet chimney at Freiburg, Germany, so that this new chimney will beat the record by just 10 per cent.

"MANHATTAN Lights" is the title of a cleverly illustrated article in *Harper's Magazine* for this month on New York, a city which darkness invades only to a limited extent, in which night as well as day has its full quota of shining hours. Commander Peary also gives his report on the Arctic Club's latest expedition to the North Pole, while Captain Mahan deals with the state of the American navy fifty years ago.

THE ENGINEERING EXHIBITION.

In connection with the forthcoming Engineering and Machinery Exhibition at Olympia, from September 19 to October 19 next inclusive, we are informed that Mr. Edgar Worthington, B.Sc., has been elected chairman of the hon. advisory council. The list of patrons, it may be added, includes the names of a large number of leading men in every branch of engineering, and the representatives in this country of many foreign interests. Local committees are also to be formed at Glasgow, Newcastle, Manchester, Leeds, Birmingham, Cardiff, Ipswich and other districts. Various sub-committees will superintend departments dealing with educational matters, and lectures, loans, inventions, &c. We also gather that as a result of the last exhibition the sum of 500*l.* was granted to the various benevolent institutions connected with the industry, and it is anticipated that this sum will be largely augmented as a result of the forthcoming exhibition.

FINISH FOR CONCRETE SURFACES.*

THE ordinary concrete structure—whether of building blocks or monolithic masonry, and whether as left by the forms or as commonly finished for exposure to view—is anything but pleasing in appearance, and this fact seems to be the principal reason for the disfavour with which some architects and engineers regard concrete as a material for construction.

The blocks usually have a bubbly, artificial-appearing surface subject to a discoloration that is generally of a sickly or lifeless hue, which offends the eye quite apart from the unpleasant effect of the machine-like regularity of such blocks as are made in imitation of rock-face ashlar. Monolithic concrete is usually finished either by painting with a thin cement wash or by floating, and it is doubtful whether really satisfactory effects have ever been produced by either of these methods on work that was in the forms long enough to get quite hard. The material that ordinarily

* A paper read before the American National Association of Cement Users by Henry H. Quimby.

segregates against the mould forms a skin that seems to have the quality of making very uncertain the attachment to it of any coating, whether of neat cement, paint, or of plaster, and if no coating be applied to it and the skin be not removed the appearance of the work, particularly after a little ageing, can be adequately characterised only in language that is too picturesque for a serious paper. There is, therefore, an active demand for a means of putting a better front upon a concrete body without overloading it in cost.

It has been suggested that a stucco finish can probably be made to adhere permanently, and it is reported that a plaster coating mixture of lime, cement and sand has been tried with gratifying results. A very handsome appearance can undoubtedly be thus obtained, but it is generally unlikely that the coating will endure wholly intact, and certain that it will not unless the surface be first carefully prepared for it by some such method as treating with acid or by picking it rough, which altogether would make an expensive finish, and if portions should loosen and come off the condition would be shabbier than anything else that can be conceived.

The mere roughening, however, of the concrete surface to insure the adhesion of a coating of any sort will itself, if completely and uniformly done, produce a pleasing and ordinarily satisfactory finish—provided, of course, that the concrete has a complete face fully flushed against the forms.

It follows, then, that tooling the surface to the extent of removing the film is a practicable and always available method of finishing it, and the tooling can be done with a bush hammer or an axe, by hand or pneumatic power. The tool should be light, and the blows only heavy enough to "scalp" the work, heavy tools and blows being liable to "stun" the concrete, particularly at and near edges. This scalping partially exposes the material of the aggregate but does not clean it. The complete exposure and cleaning will come with time and exposure to the weather if the work be out of doors; or the action of the elements can be anticipated by washing the tooled surface with a half-and-half dilution of hydrochloric acid, which of course must be thoroughly rinsed off.

The cost of such tooling, without subsequent cleaning

WARING'S

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

NEAR OXFORD CIRCUS, LONDON.

ALSO AT LIVERPOOL, MANCHESTER, AND PARIS.

with acid, has been variously found to be from three to twelve cents per square foot, according to the character and extent of the work and the equipment.

Experiments upon small blocks have shown that a very expeditious method of removing the skin is grinding with a coarse-grained emery or carborundum wheel. The skin is cut about as quickly as the block can be well passed over the wheel, and although no actual comparison has been made and there is no knowledge of a trial of it on large work with a portable wheel, it would seem that with a compressed air or electric motor and a flexible shaft the emery wheel might be used on any work with about the same facility as a power bush hammer, and the rapidity with which the wheel cuts away the face indicates that such a method of tooling will prove to be no more expensive than bush hammering. The wheel might be small in size and therefore of light weight for convenience in handling, and could be fitted with small guide rollers to limit the depth of cutting and secure reasonable evenness in the dressed surface.

Building blocks have been treated, without the preliminary tooling, by immersion for a sufficient length of time in an acid bath strong enough to dissolve the skin and some of the cement mortar between the particles of the aggregate, exposing and cleaning the particles and even leaving them in relief. This process, which is said to have been patented, includes washing after the acid bath, then immersion in an alkali bath to neutralise any absorbed acid remaining, then final washing with water. It is presumably expensive, is of necessity limited in its application to portable work, and care must be taken to avoid using in the concrete any sand or stone that is liable to injury by the acid.

It thus appears that the removal of the film and exposure to view of the clean aggregate by whatever method obtained is the essential feature of the most certainly durable and generally satisfactory surface finish of concrete. Of course it should be understood that the surface must be fully flushed—must be without cavities or visible voids between the stones. This condition can only be secured, when pressure cannot be applied, by using wet concrete thoroughly padded or forked against practically watertight forms, or by using with stiffer concrete a separate mortar or fine con-

crete applied against the face form with a trowel just in advance of the body concrete. Stiff concrete will not completely flush against the forms by mere ramming, even if the ramming does work it to a liquid on the top of the layer. Care must be exercised with every portion of the face, or voids will occur and appear when the forms are removed, and will necessitate patching. Such repairs cannot be made slightly unless at the time they are made the body is still green—before hard set has taken place. If the surface is accessible while still friable, blemishes can easily be removed without leaving a scar.

This fact suggests the desirability of early removal of the forms, and their removal after the concrete has set sufficiently to maintain itself, but before hard set has taken place, furnishes the opportunity for applying a treatment that is very convenient and inexpensive, yet produces the most pleasing and in all respects most satisfactory finish which has yet become known.

This process consists wholly in scrubbing the fresh surface with a brush and water, thereby removing the film, and with it all impression of the forms, and exposing the clean stone and sand of the concrete. If it be done at the right time—that is, when the material is at the proper degree of set—merely a few rubs of an ordinary house scrubbing-brush, with a free flow of water to cut and to rinse clean, constitute all the work and apparatus required. A little additional rubbing will bring the larger particles into appreciable relief, which heightens the effect and, in the judgment of most observers, enhances the beauty of the face.

The practicability of removing the forms at the proper time for such treatment depends upon the character of the structure and the conditions under which the work must be done. The system cannot be applied to the soffit of an arch nor to the underside of a reinforced concrete floor, because the centring must be left as support so long that the surface against it is almost stone hard. If, however, the surface material there is the same as at the sides which have been scrubbed, the soffit can be brought to match the sides by tooling and then cleaning with acid and water as before described.

The texture and colour of the surface obtained by this process will vary with the character of the aggregate of

the concrete, because in a mixture of cement, sand and stone the cement is in small proportionate volume and has but little influence on the colour of the ensemble. Some opportunity is thus afforded for the exercise of individual taste in texture and colour, and it is very easy to arrange a quiet colour scheme in any work that may be suited to it. Warm tones can be obtained by the use of crushed brick or red gravel. A dark coloured stone with light sand will produce a surface that resembles grey granite. Fine gravel gives an appearance so like sandstone that even close examination will not enable one to distinguish between them. In the construction of monolithic concrete masonry for bridges for the city of Philadelphia it is the practice to use a fine concrete or granolithic face composed of (1) cement, (2) bank sand, and (3) crushed and cleaned black slaty shale, of the size commonly used for tar roofing—say $\frac{1}{4}$ -inch to $\frac{3}{4}$ -inch. This mixture is placed against the face forms and the body concrete is placed against it and rammed into it immediately. In the three years since this process was adopted and during which it has been applied to twelve bridges, no case of separation of granolithic face has been observed, and not a single hair crack has been found, nor any kind of deterioration or tendency to discoloration noticed—indeed, the weathering seems to make the surface cleaner and more stone-like.

In general the washing is done on the day following that on which the concrete was deposited. Portland cement is used. When a quicker setting cement than usual is met, or through some other influence the surface is found upon removing the forms to be too hard for the scrubbing-brush, a wire brush is employed first, then a small block of wood or a brickbat with water and sand, which is found necessary to cut the film.

If the surface has hardened so as to require the grinding action of the sand and block, the aggregate will not be brought out into very decided relief and the face will therefore be comparatively smooth. In cold weather when crystallisation proceeds slowly the forms may require to remain two days before the washing can be done safely, and in very cold weather they have been left a whole week and the scrubbing was successful.

Consideration of the cost of the process may involve

the question of the design of the forms. When the work is such that not the whole height of it can be placed in one day it may be advisable to construct the form so that the planks can be removed without disturbing the uprights. This will add to the cost but may be compensated for by the saving in planks. In the case of a long or heavy wall where only one course can be laid in a day only one course of planks is required.

If indentations are made at the joints between courses the joints can easily be concealed. If the indentations are not desired great care must be taken to scrape thoroughly clean the top of each course quite to the face, and to use the same consistency of the new granolithic facing as that of the lower course. It is possible thus to make a joint that will not be very noticeable, but the vigilance of the inspector must not be relaxed at any point, and even then the joint will be at least distinguishable. The bead indentations are very convenient and useful in working, and in appearance they relieve what otherwise would be a large blank area.

When the planks are desired to be removable the studs are set some distance from the face, 8 to 12 inches, and the planks are braced against them by cleats nailed so as to be easily loosened. The planks are in one width the full depth of a course, either solid or made up of narrow plank battened together. A triangular bead strip is nailed to the face at each edge and the layer of concrete is finished at the middle of the top bead.

When a plank is taken off it is scraped clean of adhering cement, then oiled and reset with its bottom bead fitted into the half indentation just left by the top bead.

A couple of carpenters with perhaps a helper will take off and reset a course of plank 100 feet long in four to eight hours. The course may be whatever is desired for either convenience or architectural effect. The yardage of concrete accommodated will vary also with the thickness of the wall and the proportions of face to back. Thus the cost of changing forms will vary from 25 to 75 cents per cubic yard. In building work generally the ordinary forms can be used. Of course care must be taken not to load members too heavily while they are green and naked, but the same care should be exercised with members still in forms, because the forms, while preventing collapse, will not prevent injury to the concrete by undue pressure upon it.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-
appearance of Contracts Open, Tenders, &c., it is par-
ticularly requested that information of this description be
forwarded to the Office, Imperial Buildings, Ludgate
Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

CASTLEFORD.—March 3.—The Governors of Castleford
Secondary schools invite designs from architects practising
in the West Riding of Yorkshire for a dual Secondary
school, &c., for 300 scholars. Premiums of 50l. and 25l. to
be awarded by Mr. W. H. Brierly, the assessor. Deposit
10s. 6d. Mr. A. Wilson, clerk to the Governors, Station
Road, Castleford.

DURHAM.—March 15.—The Durham County Education
Authority invite competitive plans for a Secondary school
at Bishop Auckland. Premiums of 20l. and 10l. will be
paid for the plans placed second and third respectively.
Mr. J. A. L. Robson, secretary for higher education, Shire
Hall, Durham.

SALFORD.—Feb. 16.—Architects are invited to submit
their names for appointment as architect for the erection of
public baths. Only those with previous experience will be
entertained. A limited number will be selected by the
committee for competition. Further particulars of Mr.
L. C. Evans, Town Clerk, Salford.

SUNDERLAND.—March 30.—New church and halls for the
Presbyterian Church of England in the Side Cliff Road,
Roker, Sunderland. Premiums of 25l. and 15l. respectively.
Lithographed plans of site, &c., on application to Mr. George
W. Bain, 46 John Street, Sunderland.

CONTRACTS OPEN.

ARMATHWAITE.—March 2.—For the erection of a stone
bridge of four arches across the river Eden, in the parishes
of Ainstable and Hesket-in-the-Forest, within half a mile of
Armathwaite station, Cumberland. Deposit 1l. 1s. Mr.
Geo. Jos. Bell, M.I.C.E., county surveyor and bridge-master
for Cumberland, The Courts, Carlisle.

BIRKENHEAD.—Feb. 26.—For alterations and additions
to the workhouse at Tranmere, for the Guardians. Mr.
Edmund Kirby, 3 Cook Street, Liverpool.

"BRIGHTSIDE
IMPROVED" PATENT
CALORIFIER.

BRIDGNORTH.—Feb. 21.—For the erection of a laundry and alterations at the workhouse, for the Guardians. Mr. E. Trevor, architect and surveyor, High Street, Bridgnorth.

BRADFORD.—Feb. 21.—For the reinstating of spinning-mill in Filey Street, Hammerton Street, after damage by fire. Messrs. Walker & Collinson, architects, Cheapside Chambers, Bradford.

BRIGHTON.—Feb. 22.—For the erection of a water-tower in the asylum grounds, for the visiting committee of the Brighton County Borough asylum, Haywards Heath. Mr. J. G. Gibbins, of the firm of J. G. Gibbins & Son, architects and surveyors, 3 Palace Place, Brighton.

BRISTOL.—Feb. 19.—For the construction of retaining walls on the north side of Fox Lane, Stapelton Road. Deposit 2*l*. The City Engineer, 63 Queen Square.

BURNLEY.—Feb. 19.—For construction of a potato shed, weigh office, weigh-machine foundations and the covering over of colliery tramway at Danes House, for the Lancashire and Yorkshire Railway Co. The Engineer's Office, Hunt's Bank, Manchester.

CAMBORNE.—Feb. 16.—For the erection and completion of two houses in Trelowarren Street. Mr. Edwin H. Crispin, Trelawny Road, Camborne, Cornwall.

CHARING HEATH.—Feb. 28.—For renovating the interior of the school-house, for the managers of the Charing Heath school. Rev. J. W. Sothern, Charing Heath, Kent.

DUNDEE.—Feb. 18.—For the erection of boundary walls and other masonwork in connection with the Gaggie filters, for the Dundee water commissioners. Deposit 1*l*. 1*s*. Mr. George Baxter, C.E., M.I.C.E., engineer and manager, 93 Commercial Street, Dundee.

GLASGOW.—Feb. 18.—For the construction of an engine-shed, sand-kiln and water-tank at Yoker in connection with the Clydebank Dock branch, for the Caledonian Railway Company. Deposit 2*l*. 2*s*. Messrs. Formans & M'Call, C.E., 160 Hope Street, Glasgow.

GLASGOW.—Feb. 23.—For the work of constructing the substructure of machinery buildings, Shieldhall, for the Corporation. Mr. W. D. Hamilton, 59 Bath Street, Glasgow.

GREAT AMWELL.—Feb. 20.—For the construction of bays at Amwell Marsh pumping station, Great Amwell, Herts, for the Metropolitan Water Board. The Clerk of the Board, Metropolitan Water Board, Savoy Strand, W.C.

GLOSSOP.—Feb. 23.—For the construction of a convalescent and nurses' home. Deposit 1*l*. 1*s*. Messrs. Bulman & Vinycomb, architects, 67 and 69 Chancery Lane, London, W.C.

GRAVESEND.—Feb. 19.—For alterations and additions to Victoria House. The Borough Surveyor's Office, Gravesend, Kent.

HALIFAX.—Feb. 18.—For the mason, joiner, carpenter, plasterer, slater, painter, plumber's heating and steelwork required in the taking-down of the old school at All Saints, Salterhebble, and erection of a new school on the adjoining site. Messrs. Joseph F. Walsh & G. H. Nicholas, architects, Museum Chambers, Halifax.

HUNSTANTON.—Feb. 23.—For alterations and additions and the erection of two shop-fronts in Westgate. Mr. H. Guy, Hunstanton.

IRELAND.—Feb. 22.—For the erection of seating for the Second Presbyterian church, Ballywalter. Messrs. J. & Mackenzie, architects, Scottish Provident Buildings, Belfast.

KEIGHLEY.—Feb. 21.—For the erection of a warehouse at Holme Mill. Messrs. John Haggas & Sons, architects, North Street, Keighley.

KINGSTON-ON-THAMES.—Feb. 19.—For pulling-down and erecting a three-span iron roof with skylights, gutters, stanchions, covering an area of about 6,580 feet at The Old House, Esher, Surrey, carting to and re-erecting same at North Common farm, New Malden, Surrey, repairing the structure and providing new foundations and sides, for the Guardians of Kingston Union. The large kitchen at the club to be removed. Mr. Jas. Edgell, clerk, Union Club, Coombe Lane, Kingston-on-Thames.

KIRBYMOORSIDE.—March 1.—For reseating and renovating Rudland Primitive Methodist chapel, near Kirbymoorside. Mr. Wm. Atkinson, Sleightholmedale.

LITHERLAND.—Feb. 25.—For the construction of a school and female conveniences, children's shelter, &c., in the

TRADE NOTES.

ALTERATIONS and additions are being carried out at Cleeve House, Seend, by Messrs. Dove Bros., Ltd., under Mr. W. B. Medlicott, of London. The dressings are of Doultling stone from the Chelynch quarries.

THE payment of the "London and Lancashire" to its San Francisco policyholders will amount to 1,750,000*l.* This is the largest sum which has ever been paid by a British company for a single fire. The claimants numbered 2,995, and twenty-five special adjusters were occupied continuously for over four months.

At the Builders' Exchange, High Street, Birmingham, in future will be found club accommodation. This will be no doubt popular with the members. The opening will be on the 28th of this month, and the secretary of the Builders' Exchange has arranged for one of the popular lectures, at which there will be several demonstrations of use and value to those engaged in building operations.

MESSRS. GEORGE MILLS & Co, hydraulic engineers, of Radcliffe, who are proprietors of the "Titan" sprinkler, have received the following satisfactory communication from the secretary of the Ruby Mill Company, Ltd., Water Sheddings, Oldham, dated February 9:—"We have pleasure in testifying to the prompt action of your 'Titan' sprinkler. We had a slight fire in our cotton room, but the sprinkler went off immediately, and was very effective in preventing a serious fire."

THE Local Government Board have written to the Brighton Town Council sanctioning the borrowing by the Council of 21,200*l.* for various purposes in connection with the electricity undertaking.

ELECTRIC NOTES.

MR. A. A. G. MALET, Local Government Board inspector, held a recent inquiry at the Guildhall, Worcester, into the application of the Corporation for sanction to borrow 6,500*l.* for the purposes of the electricity undertaking, viz. the extension of the Hylton Road station to accommodate the whole of the steam production plant, provision of new plant, and the repayment of upwards of 4,000*l.* of the original loss in respect of plant which is about to be "scrapped." It is estimated that the rearrangement of the works will effect a saving of 1,200*l.* per annum.

THE Edinburgh Town Council have rejected a motion expressing disapproval of the decision of the recent special meeting of the Corporation to cable the Gilmore Place round of tramways. The Council subsequently adopted a recommendation by the tramway committee that the tramway lines authorised by the Act of last year from Leith Street to Canon Mills and along East Claremont Street to Pilrig Street be cabled. It was agreed to appoint Sir Alexander Kennedy as cabling engineer, conjointly with the burgess engineer.

THE Salford Town Council have confirmed the appointment of Mr. M'Cowen as electrical engineer at a salary of 800*l.*, rising to 1,000*l.*, and defeated the proposal that the commencing salary should be 700*l.* On the previous day at a special meeting of the Belfast Corporation in committee it was resolved by the casting vote of the Lord Mayor—nineteen having voted for and nineteen against—to increase the maximum salary of Mr. M'Cowen from 800*l.* to 1,000*l.* with a view of inducing him to continue to hold his position of electrical engineer in Belfast, and reject the Salford appointment.

WITH the object of reducing the number of accidents in factories the Association of Italian Manufacturers, whose headquarters are in Milan, announce an international competition for prizes. A gold medal and 8,000 lire are offered for a system to eliminate the danger of a contact (of whatever resistance) between the primary and secondary circuit of alternate current transformers and their respective lines, and a gold medal and 10,000 lire for a hand crane or winch so constructed that without sensible reduction of lowering

THE contract for the additional steam dynamos at the Belfast Corporation electric station has given rise to considerable diversity of opinion amongst engineers in that city, the principle at issue being the relative merits of the turbine engine as against the reciprocating engine. The question of further plant has been rendered necessary in order to meet the increased demand for electrical energy in the winter of 1907. There are at present 255,000 candle-power lamps connected, and applications for a further 20,000. The rate of increase for the last few years has been very considerable, and it is anticipated that this increase will continue owing to the reduced price for energy. At a recent meeting of the Corporation in committee there was discussed the report from the tramways and electricity committee on the question, referred back to them last monthly meeting, of accepting the tender for two 500 kw. turbo dynamos, at 14,956*l.*, from Messrs. Willans & Robinson. Eventually the matter was adjourned for a week pending the course that events will take concerning the office of electrical engineer.

THE agenda paper of the Woolwich Borough Council contains a report from the electricity committee on the subject of the electricity undertaking. The committee print for the first time the comments of Sir A. B. W. Kennedy, who states that upon the two generating stations the Council have spent 253,732*l.*; that the erection of the Plumstead station was a serious mistake, and largely responsible for the unfortunate position in which the undertaking now finds itself. In these circumstances the electricity committee recommend the closing of the wiring department from March 31, pointing out that the district auditor stated, in his report in reference to the electricity department, "I must very fully endorse the financial conclusions on which the consulting engineer bases his advice to discontinue this department with the least possible delay." Only one member of the finance electricity committee dissented from the recommendation that the wiring department should be closed, by which means many members of the Council hope to save 2,000*l.* a year.

VARIETIES.

THE annual meeting of the National Provident Institution will be held on Friday next. The report shows the continued prosperity of the business. The accumulated fund amounted on November 20 to 6,428,820*l.* 11*s.* 3*d.* The sum paid in claims since 1835 has reached the large amount of 13,022,191*l.* 19*s.*

MESSRS. M'KENZIE BROS., builders, Darlington, have received the contract for the new Darlington Theatre and Hippodrome, at a total cost of 10,000*l.*

THE Linlithgow Town Council are considering the desirability of erecting billposting and municipal hoardings within the burgh.

A LARGE clock has just been erected in the church of St. Cross, Winchester, which shows time on two 6-foot dials, and is fitted with all the latest improvements and generally to the designs of the late Lord Grimthorpe. The work has been carried out by Messrs. John Smith & Sons, Ltd., Midland Clock Works, Derby.

THE Rochdale Town Council discussed last week the question of emission of black smoke from mill chimneys. The health committee recommended that it was not advisable that a time limit should be adopted, but an amendment was moved that a time limit be fixed of three minutes per half hour for one, two or three boilers, and four minutes per half hour for four or more boilers, and this was carried.

AT Cincinnati, Ohio, a Catholic cathedral to cost 1,000,000 dols. is to be erected. On a 10-acre tract of land given for the purpose north of Norwood it is proposed to erect the new cathedral, a seminary building costing about 175,000 dols., a cathedral home for the archbishop costing 50,000 dols., a parish priest's house, a school and a teachers' house. It is planned to have the buildings face a boulevard 100 feet wide. The site is known as Norwood Heights.

THE Agent-General for New South Wales is advised by his Government that labour is so scarce that it is impossible to get a number of important contracts carried out. A large number of able-bodied men used to manual labour are urgently required. Wages vary from 7*s.* to 8*s.* a day, according to the class of work. The Government will contribute liberally towards the passage money of such men.

THE Bradford City Council on Tuesday reconsidered the Esholt scheme for dealing with the sewage of the city. The cost of the scheme is estimated at 1,250,000*l.*, and a month ago it was referred back to the committee to see if the cost could be cut down. The sewage committee brought their proposals forward unchanged, saying that they could not modify them, and they were adopted by thirty votes to twenty-five. Application will now be made for borrowing powers.

MAJOR J. STEWART, R.E., Local Government Board inspector, concluded on Saturday a three-day inquiry into an application by the Sunderland Rural District Council for sanction to borrow 21,500*l.* for the purpose of erecting dwellings for the mining population of Ryhope and Tunstall, so as to put a stop to the serious overcrowding, with which the authorities are powerless to deal owing to the lack of accommodation. There was a strong opposition on the part of property-owners and the railway company.

A REPORT showing the individual salaries of subordinate officials, clerks, &c., in the employment of Dundee Corporation has been issued. In the burgh engineer's office the servants number thirteen, and the payments in salaries total 1,222*l.* 13*s.* The water engineer's office staff of nine costs 915*l.*, including one at 250*l.* The gas works office takes in salaries 456*l.* 6*s.*, divided amongst six individuals. A staff of equal size in the electrical engineer's office costs 421*l.* 4*s.*, and clerical work in the tramway manager's department involves a salaries bill of 556*l.* 8*s.*, divided amongst nine clerks.

THE Corporation of Croydon decided recently to provide and fix washers to leaking taps free of charge, in the hope of preventing the waste of water. The local plumbers have held a meeting to protest against this action. The Chairman said he estimated that there were 96,000 cold-water taps in the borough, and that about 3,692 needed attention every week. These figures, he declared, showed the absolute ridiculousness of the estimate furnished to the Borough Council that the innovation would only cost 15*l.* per annum. A resolution was carried asking the Council to reconsider the matter, and it was decided that a deputation should explain the views of the plumbers, who regard the change as totally unfair to their interests.

THE new dock works of the Swansea Harbour Trust are being vigorously carried on. The works are of large extent, 400 acres are enclosed by a sea wall of a mile and three quarters. Of this, 68 acres are devoted to the King's Dock, with the usual adjuncts for timber floats, &c. The contract entered into was for 796,000*l.*, and there are to be put in the new dock 440,000 cubic yards of stone hearth, 105,000 cubic yards of sand backing, 270,000 cubic feet of granite ashlar, 30,000 cubic feet of local dressed stone, 75,000 tons of Portland cement, 280,000 cubic feet of timber for permanent work, and 4,300,000 bricks. The work of excavation is expected to reach 3,000,000 cubic yards, and the length of the dock will be 875 feet.

MR. A. A. G. MALET, inspector of the Local Government Board, held an inquiry on the 12th inst. at the town hall, Cheltenham, into an application by the Corporation for sanction to a loan of 45,195*l.* for works of sewerage and sewage disposal. The chief portion of the loan, viz. 34,000*l.*, is required for the outfall sewer and works on Haydon farm, and 10,310*l.* for the Arle bank outfall sewer. The scheme has been put forward to remedy complaints made by some of the parishes below the town of nuisance arising from the pollution of the Chelt and of the Hatherly brook. The scheme provides ample means for dealing with six times the dry weather flow, and as to the disposal of the sewage, a really up-to-date system of septic and sedimentation tanks is to be introduced on the Haydon farm.

THE Lancashire County Council have by a majority of two adopted the following resolution:—"Contractors tendering for or executing work under the Council must be paying to the whole of their workpeople the standard rate of wages in the several districts where their people are actually engaged in the execution of work, and must also be observing the hours and conditions of labour as well as the aforesaid rate of wages recognised by the association of employers and the local organised bodies of workers in the various trades in the several districts where the work is being done, and must not prohibit their workpeople from joining trade societies or continuing members of such societies. In no case shall the aforesaid wages be lower than the hours higher than the minimum and maximum respectively recognised by employers and an organised body of workers in Great Britain."

VOLUME LXXVI. OF THE ARCHITECT
Handsomely bound in Cloth Gilt Lettered, price 1*s.*
Imperial Buildings, Ludgate Circus, E.C.

THE Burslem Town Council on Monday considered a report received from the United Society of Stone Dressers, stating that the members of the society in the Macclesfield and Bollington districts had struck work on account of continued reductions in wages and oppressive working conditions, and requesting the Council to withhold orders from the society mentioned, pending a settlement of the dispute. The Council clerk was instructed to reply, stating that the fair-wage clause was inserted in all contracts with the Council, and that the borough surveyor was instructed to see that it was strictly adhered to.

THE Shrewsbury Town Council recently applied to the Local Government Board for sanction to borrow 5,000*l.* for erecting and improving the supply of drinking water to the borough. The Local Government Board declined to sanction the proposal unless the Council would give an undertaking to proceed with a scheme for the general supply of water to the town, and the Board urged that Mr. G. R. Strachan's scheme, which was estimated to cost 88,000*l.*, should be proceeded with without the consent of the ratepayers. A deputation, consisting of three members of the committee, were appointed to wait upon the Local Government Board to explain the urgency and importance of the question.

MESSRS. HARVEY & McEWEN, of Birmingham, architects of the Bournville estate, have been successful in a competition organised by the Sheffield Corporation for the purpose of obtaining plans for the development of 25 acres remaining on their estate at High Wincobank. The Local Government Board is to be asked to authorise the borrowing of 500*l.* for the cost of constructing the roads and sewers, and the city surveyor is to engage the services of the prize-winners to assist him, as far as he may think it advisable, in the preparation of the necessary sections. The whole of the area will not be laid out at once, but as soon as powers are obtained, progress will be made with that portion which is necessary for the purposes of the model-cottage exhibition to be held there shortly.

It is anticipated that the Royal Agricultural Society's show to be held this year at Lincoln will prove most successful. Apart from the fact that the condition of the soil will have an important bearing on the issue, the picturesque and interesting city will of itself contribute

largely in attracting visitors from all parts. The development of Lincoln's traffic has of late been very great, and to meet the requirements the Great Central Company decided some time ago to erect a new goods warehouse, and install a large yard complete with the latest appointments for the special class of goods dealt with at Lincoln. The heavy goods and live stock traffic the company will handle in connection with the Royal Show will be dealt with in the new goods yard, and we understand that special facilities will be announced in due course in favour of exhibitors and the general public attending the Show.

A CIRCULAR has been addressed to county, borough and district councils by the Local Government Board stating that on several occasions they had had before them the question whether, when a local authority themselves carried out works by means of borrowed money, the wages of workmen permanently employed by the local authority could properly be defrayed out of the loan if the men were engaged in the work. The Board had reason to believe that the view which they had taken with regard to this matter had not been clearly understood in some instances, and in order to remove any misapprehension with regard to it they forwarded a copy of questions put to the President on the subject in the House of Commons last session (May 2 and December 20), together with a copy of his replies.

THE Manchester water committee of the Town Council find that in comparison with the corresponding period of last year the consumption of water has increased by three million gallons a day. Should the increased consumption proceed at the rate now recorded, they may within ten years find they have reached the limits of their supply unless they should adopt means for restricting the area which they supply. The committee are of opinion that the abnormal increase in water consumption pointed to some degree of waste, although industrial concerns are increasing the use of water, and that the spread of the water-closet system has a like effect. Nevertheless, the reported increase is on so large a scale it has been referred to a sub-committee to inquire into the matter, with directions to do all that is possible to prevent waste. They intimated at the same time that the public might do much individually by greater care in preventing waste of water.

THE Royal Hotel, Manchester, one of the most important commercial houses in the North of England, the lease of which expires on June 24, was offered for sale by auction at the Albion Hotel, Manchester, on Monday. It was described as the "most conspicuous building site in Manchester." The plot was freehold, and contained 1,325 superficial square yards of net building land, in addition to which there were valuable cellar areas fronting Market Street, Mosley Street, Meal Street and West Mosley Street, with buildings thereon, comprising the Royal Hotel, two shops and offices, and a warehouse. The bidding started at 50,000*l.*, and with bids of 10,000*l.* the price was run up to 117,000*l.* Then it stopped, and there was no further bid. The property was withdrawn at that figure. When the sum of 110,000*l.* was reached the auctioneer said that double that amount would be required for the property. Not having been sold in one lot, the property was afterwards offered in two lots. The first was withdrawn at 72,000*l.*, and for the second no bid was received.

THE Roads Improvement Association have been officially informed that the Local Government Board will appoint one of their engineering inspectors to attend the trials of the tar-spreading machines. His Majesty's Office of Works have also deputed an officer to watch the experiments and report to the Board. The chief engineering inspector of the Irish Local Government Board, Mr. P. C. Cowan, has been appointed one of the judges in the competitions with the approval of his Board. There are two competitions which are quite distinct. One is for the best machine for spreading tar over existing road surfaces, which will be judged entirely by the results of the operation, and the other is for the best preparation of tar for road purposes. Full particulars can be obtained on application to the hon. secretary of the Roads Improvement Association, 1 Albemarle Street, Piccadilly.

THE medical officer of health for the Port (Dr. H. Williams) makes special reference in his latest report, issued on Monday, to the pollution of the river Thames. He states that water passing over Teddington Weir shows evidence of considerable pollution, a fact not to be wondered at when it is considered that the sewage effluent from the houses at Kingston and Surbiton is discharged into the

river above that point. The evidence of pollution increases as the river reaches London Bridge. In this part of the river there are several storm outfalls from the main sewer of the London County Council, especially at Hammersmith and Blackfriars. At Greenhithe there is a great increase of pollution due to the discharge of some 200 millions of gallons per day of sewage effluent at Barking and Crossness from the London County Council sewers. There is an increase in the pollution below Southend Pier. The medical officer further reports that the pollution from Barking and Crossness is brought up on the flood tide as far as London Bridge.

MR. J. W. HIRST, secretary of the Manchester Council for the National Registration of Plumbers, writes:—"At a lecture given in the Royal Technical Institute, Salford, on Thursday night it was pointed out that in several towns registration was a condition of authorisation to do plumbing work. Recently at St. Helens an applicant was refused authorisation on the ground that he was not registered. He complained to the Corporation. The registration authorities were asked why they had refused registration. The Corporation confirmed their decision, and insisted on registration as necessary to authorisation. But reference to the official list issued by the Manchester water committee shows that it contains the names of men as authorised to carry out plumbing work who have no connection even with the building trade, not to mention the plumbing trade. The importance of good plumbing work in the interest of public health is such as demands the exercise of great care before applicants are added to the list of authorised persons."

THE executive of the British Fire Prevention Committee have formed among the members of the committee representatives of the public authorities subscribing to the committee a special commission to "report upon and define the aggregates suitable for concrete floors intended to be fire-resisting, having due regard to questions of strength, expansion and the chemical constituents and changes of the aggregates." In forming the commission it has been considered of importance that the various technical interests should as far as possible be represented. Sir William Preece will act as chairman and Mr. Matt. Garbutt will act as hon. secretary. The commission will include representatives of the Admiralty, the War Office, the Metro-

THE "DRAWWELL" GRATE

WAS PLACED

politan Asylums Board and the Norwich Corporation. The services of Mr. Cecil H. Desch have been retained by the British Fire Prevention Committee for any chemical research work required during the inquiry.

MR. PATRICK GORMAN, the United States Vice-Consul General at Montreal, in a report to the Washington Bureau of Manufactures, says that a company has been formed for the express purpose of constructing a canal between St. Johns and Montreal. It is said that three miles from Longueuil, which is on the opposite side of the St. Lawrence river from Montreal, near the Little Montreal river, there is a fall of 74 feet. With the assistance of this the engineers say that it is possible to obtain for manufacturing purposes 100,000 horse-power, which would enable manufacturers to place their plant alongside the canal. If this canal project goes through, then the waterway between St. Johns and Montreal will be reduced to 21 miles instead of 94, as at present vessels have to go down the St. Lawrence 45 miles to Sorel, the entrance of the Richelieu river, which connects with Lake Champlain. The company estimate that they can complete the work in two years at a probable cost of 2,400,000l.

THE *Board of Trade Journal* says that a despatch has been received at the Foreign Office from the British Legation at Santiago, forwarding a copy, with translation, of the law for the reconstruction of Valparaiso, passed by Congress and approved by the Council of State. The despatch states that the question of a law for the admission free of duty of building materials, required for the work of reconstruction, has not yet come before the chambers. The Director of Customs at Valparaiso has written a report strongly urging that no such measure should be passed, giving as his reasons that labour in Chile would be deprived of the protection it enjoys at present, and that the two years during which it is proposed to admit building materials free of duty would be employed in collecting a stock of materials sufficient for building requirements not only for Valparaiso, but for the whole of Chile for several years to come. He considers, however, that an exception might be made in favour of ready-made houses such as could be imported in sections.

A new gasholder has been opened at the municipal gas-works of Widnes. The new holder has a capacity of

1,000,000 cubic feet. It is the first instance existing in which the "spiral-guided" principle has been applied to a telescopic gasholder of four lifts. In holders working on the spiral-guided system no external guide-framing is necessary, the whole of the guiding and lateral stress of wind-pressure being taken up by the spiral guide-rails attached to the side sheets of the holder. When the four lifts of this new holder are extended to their full height the top of the fourth is 100 feet above the water level. No holder has previously been carried to this height without external guide-framing. There are under 300,000 people in the town, but the annual consumption of gas is 284,000,000 cubic feet. There are 4,240 penny-slot consumers, and even the poorest houses are equipped with cooking stoves, which are fitted free and loaned for a penny a week. The selling price of the gas is 1s. 3d. and 1s. 1d. per 1,000 feet, and for motive-power 11d. per 1,000 feet. This is the lowest charged by any gas authorities in the world.

THE Board of Trade have issued the annual return of capital and traffic for 1905-6 of the tramways and light railways (street and road) of the United Kingdom. Since the year 1878 the route length of line open for traffic has increased from 269 miles to 2,240 miles, the capital expenditure from 4,207,350l. to 58,177,832l., the number of passengers carried from 146 millions to 2,236 millions, and the net receipts from 230,956l. to 3,807,415l. Of the total of 1,491 miles of line owned by local authorities, 1,276 miles are worked by those authorities themselves, and the remaining 215 miles by leasing companies. Last year the route mileage open of electric line was 1,780 miles out of a total of 2,117; this year it is 1,994 miles out of 2,240. The mileage not worked by electric traction has further diminished from 337 miles to 246 miles. The number of undertakings belonging to local authorities (175 out of 312) has increased since last year by one, and the number belonging to other parties has diminished from 146 to 137. Local authorities who work as well as own their tramway undertakings have made a net profit of 2,529,752l. on the year's traffic, out of which they have applied 663,336l. towards the reduction of tramway debt and 205,981l. in relief of rates, while carrying 623,617l. to reserve and renewals funds.

FIRE-RISKS

MINIMISED BY USING

PATERSON'S

FIREPROOF ELECTRIC CABLES AND WIRES

These Cables are highly fire-resisting and tend to subdue any burning mass without, and any are flame within, the insulation. Specially suitable when wiring HOSPITALS, INSTITUTIONS, PUBLIC BUILDINGS, THEATRES, PRIVATE HOUSES, &c. The following testimonial from one of the largest Corporations in the British Isles is **SURELY CONCLUSIVE**:-

"I have tested the samples of Fire-proof Cable which you have forwarded to me, and I find that **their fire-resisting qualities are satisfactory**, I have therefore pleasure in enclosing order for the cable required."

TUNSTALL & CO., Ltd., Leeds Bridge, LEEDS.

ESTABLISHED 1837.

Telephone 4120 (two lines).

Telegrams: "TUNSTALLS, LEEDS."

THE docks and pilotage committee of Aberdeen Harbour Board have under consideration a scheme for the improvement of Provost Blaikie's Quay for a distance of 1,500 feet from Regent Bridge eastwards. It is proposed to construct a timber wharf, 22 feet wide, in front of the present quay wall, increasing the width from 61 feet to 83 feet, thus enabling a double line of rails to be laid. The cost is estimated at 29,500*l*.

RUSKIN PARK, DENMARK HILL.

THIS new park which is now open to the public is beautifully timbered and has an area of over 24 acres, with a frontage of about 1,050 feet to Denmark Hill, nearly opposite to the house, 163 Denmark Hill, where John Ruskin spent about twenty-five years of his life. Until about 1845 he resided at 28 Herne Hill, but his father then determined to secure the ampler accommodation afforded at 163 Denmark Hill, which is but a short distance off. This house was John Ruskin's home, with the exception of a short interval following his marriage, until his mother's death in 1871 (his father having died in 1864), and in 1872 he removed to Brantwood, Coniston Lake. It was at 163 Denmark Hill that Ruskin wrote vol. ii. of "Modern Painters," "The Seven Lamps of Architecture," "Stones of Venice," "Unto this Last," "Sesame and Lilies," "The Crown of Wild Olives," and other works.

The cost of the park, which forms part of the old Sanders Estate, it may be added, was 2,000*l*. an acre, and the L.C.C. contributed 25,000*l*., the Camberwell Borough Council 10,000*l*., the Lambeth Borough Council 5,000*l*. and the Southwark Borough Council 2,500*l*.

WORKS IN SHEFFIELD.

THE Sheffield City Council have several schemes under discussion, including the following:—The health committee want the surplus land between Cavendish Street and Victoria Street for the enlargement of the Glossop Road baths, but the improvement committee has decided to build shop property of three-storey elevation. It is proposed to build a church and a school on the Corporation's model estate at High Wincobank. Thirty-five more houses are to be erected. To lay out about 25 acres of land at

High Wincobank for the model cottage exhibition the City Council is seeking power to borrow 11,500*l*. The tramways committee have decided to double the tramway track in Barnsley Road from Norwood Road to Osgathorpe Road at a cost of 1,520*l*. The city hospital committee recommend an expenditure of 7,000*l*. for extensions of the isolation block at Lodge Moor hospital. The proposed reconstruction of Attercliffe bridges has been considered by the improvement committee. The City Surveyor's estimate of the cost is Staniforth Road bridge 7,000*l*., Broughton Lane Canal bridge 5,000*l*. and Broughton Lane railway bridge 11,000*l*. The improvement committee think that the present time is inopportune for the expenditure of so large a sum as 23,000*l*. The markets committee have again been considering the question of the rearrangement of the markets, and they recommend the City Council to remove Fitzalan Market to a site between the new street which will run from Waingate to Furnival Road and the river Don. They suggest that on the site shall be erected a new retail fish and meat market and central abattoirs and wholesale meat market. The approximate cost is 50,000*l*.

WATER SUPPLY.

SOME large and important water supplies have been recently completed by Mr. R. D. Batchelor, of 73 Queen Victoria Street, London, and Chatham, for the Sutton District Water Company. Under Mr. W. Vaux Grahams, M.I.C.E., he has made two wells of 8 feet diameter each, with 3 feet diameter borings to a depth of 450 feet each. Each of these wells when tested yielded the enormous average yield of 1,500,000 gallons of water per day. The borings are lined for a depth of 100 feet with heavy cast-iron liners, with water-tight joints, to prevent the possibility of surface contamination. Gas-engines and suction plants have been put down, so that the Sutton District Water Company have made every provision for the ever-increasing demand for water in their district.

Mr. Batchelor has also recently completed the following contracts:—Another boring for the Sheppey Gas Company at Sheerness, with a total depth of 450 feet. Enlarging and deepening the old boring at the Watford Union to 12 inches diameter and to a depth of 342 feet. The result

of this work is highly satisfactory; the old pumping machinery has been removed and a complete new installation is being put in. The consulting engineer is Mr. John Blackburn, of Bushey, Herts. Another well and boring (making the fourth contract) at the Thames Paper Mills, Purfleet, Essex, which has been tested to over 600,000 gallons of water per day. Although this is a large quantity, another well and boring put down some fifteen years ago yielded the abnormal quantity of 2,422,224 gallons per day.

Mr. Batchelor has also the following large and important contracts at present in hand:—A 20-inch boring for the *Daily Telegraph* paper mills at Dartford, which will be carried down to between 300 feet and 400 feet from the surface, and from which it is expected 1,000 gallons per minute will be obtained. Another interesting work is at the water supply for Dr. Barnardo's Home for Girls at Barking, Ilford, Essex. Two electric motors are already fixed, one of which is now driving the laundry machinery and the other is for driving the deep borehole pump which is to be put down as soon as the large boring which is now in hand is completed.

NEW CATALOGUE.

It would be difficult to determine when wood panelling first became the favourite decoration of English buildings. Having the advantage of real utility, as well as a pleasing appearance, it suited all tastes. There is no doubt of its use in Mediæval times, and it was apparently considered as essential in the mansion-houses which were erected in the sixteenth century. In truth it can be said of panelling that it never was entirely out of fashion in England. It is satisfactory to find that Messrs. Liberty & Co., who have done so much for the decoration of houses, have arranged for the supply and fixing of oak panelling in Elizabethan, Georgian and other styles. They are able to panel a room measuring 18 feet by 12 feet from as low a price as 25/. Their catalogue shows about twenty varieties, and suggestions are also given about the treatment of the walls above the panelling. Prices are given, and the plates will be useful to many people who wish to introduce in their houses a superior kind of decoration which is no less expressive of homely comfort.

"LAXTON."

This year "Laxton" has attained its ninetieth edition. We suppose there is no practising architect in England who has used the first edition. But, judging by early copies which have survived, the Price Book was originally very slim if compared with its latest descendant. "Laxton" is now a portly volume of over 800 pages, if we include the index and the advertisements. The remarkable development is to be credited to Messrs. Kelly, Ltd., who have not only given no less than 73,000 prices, but have taken care to have them as correct as possible. The multiplex character of a builder's business is nowhere better exemplified than in the pages. The supplementary information is also varied, and has an official character. "Laxton" is now a comprehensive representative of the building trade, and the publishers have merited success.

TORSION TESTING.

THE Woolwich Polytechnic have just had delivered to their order one of the latest makes of torsion-testing machines, which has been specially designed by W. & T. Avery, Ltd., of Birmingham and London, for the use of technical schools, polytechnics and universities. We are informed that this is an exact replica of a machine supplied to the Birmingham University. It has a capacity of 10,000-in.-lb. The machine consists of a substantial base plate, to which are bolted two strong cast iron standards. One standard encloses the two indicating levers and the other the straining gear. The levers are of wrought-iron and fitted with hardened steel knife-edges, the connection between the levers being by wrought-iron links having hardened steel bearings. The main lever has a fulcrum consisting of hardened steel cones and cups bearing upon rings of hardened steel balls. The second lever has two knife-edges, either of which can be made to act as a fulcrum by the movement of a hand lever according to whether the strain applied is likely to be light or heavy—i.e. in one position of the hand lever the machine is 10,000-in.-lb. capacity, and in the other 5,000-in.-lb. capacity.

The steelyard is Avery's improved type, in which the poise is propelled along the steelyard by means of a central screw. The screw is rotated by means of machine-cut

gearing controlled by a hand-wheel. The connection between the hand-wheel, which is on a fixed portion of the framing, and the gearing upon the steelyard is made at the point of no motion, *i.e.* at the fulcrum; consequently any pressure of the hand upon the hand-wheel is not communicated to the steelyard, thus obviating any possibility of the specimen being prematurely broken. The steelyard is graduated from zero up to 1,000-in.-lb. single power (2,000-in.-lb. for double power) by divisions of 10-in.-lb., and a vernier scale upon the poise subdivides this again into divisions of 1-lb. (single power). A graduated scale at the end of the steelyard in the view of a microscope having a divided line upon its lens enables indications of 1-10th-lb. to be taken. The remainder of the capacity of the machine is provided for by the use of four loose proportional weights suspended from the end of the steelyard, each representing 1,000-in.-lb. single power, or 2,000-in.-lb. double power.

The straining-gear consists of a worm-wheel rotated by a hand-wheel. The worm-wheel and worm-shafts are turned and are carried in brasses fitted into the cast-iron standards.

THE SCOTTISH PROVIDENT INSTITUTION.

On the important site known as Nos. 1 to 4 Lombard Street, adjoining the Mansion House, there has been erected, within the period of ten months and at a cost of from 80,000*l.* to 90,000*l.*, a building of the first rank, which replaces the stucco fronted brick one erected from the designs of Sir Robert Smirke, R.A., about 1830.

The new building, which was opened a few days ago, is of a very substantial character in Portland stone, erected from the designs of Messrs. Dunn & Watson, of Lincoln's Inn Fields, by Messrs. W. Cubitt & Co., and it is of a Classic type. The main entrance is in the form of an open loggia, separated into three bays by two great stone pillars. Under this open porch or loggia there are three doors. That to the left, forming No. 2 Lombard Street, is the main door of the Canadian Bank of Commerce. The central door is No. 3 Lombard Street, and the great opening is filled with two pairs of massive mahogany doors, with bronze grilles protecting the openings in the upper part of them. The hall is oblong in form, built in Portland stone, with an

elliptical stone dome supported on columns, and having a beautifully carved wreath in the upper part. The floor of the loggia, which is external, is of stone in diamond-shaped forms; in the hall harmonious coloured marbles have been laid in a star-shaped pattern under the dome, and in semi-hexagonal forms on the staircase.

In the centre of the semicircular part of the staircase is the entrance to the offices of the Scottish Provident Institution, the parent company, to whose enterprise the whole scheme is due.

That part of the building known as No. 1 Lombard Street, the site formerly occupied by Smith Payne's Banking House, and again leased to the company with which their business has amalgamated—the Union of London and Smith's Bank—comprises all that corner next the Mansion House, extending back to George Street.

Throughout the building there are gas and electric mains on every floor, as well as the main telephone calls; while in addition to the fireplaces, there is a complete installation of hot-water heating throughout. On the top floor the sanitary conveniences are grouped together, and there are three blocks of lavatories, besides a barber's shop and the housekeeper's rooms adjacent.

The whole construction is fire resisting, the walls being in brick and stone and the floors in steel and concrete. There are also fire-escape doors and staircases in accordance with the requirements of the London County Council, and fire hydrants on all floors.

THE CHALKWELL PARK ESTATE, WESTCLIFF-ON-SEA, ESSEX.

This house is about to be erected on the Chalkwell Hall Park Estate, Westcliff-on-Sea. The lower part will be faced with red bricks, and the upper portions finished with stucco and half-timber work in the gables and the roofs covered with red tiles. The hall, staircase and reception-rooms are to be panelled in oak, and with deep friezes level with the top of architraves over doors. The hall will be laid with red tiles and the reception-rooms with oak wood-block flooring. Messrs. Cabuche & Hayward, M.M.S.A., of Westcliff-on-Sea, are the architects.

BRICKMAKING ON THE NORBURY ESTATE.

THE finance committee of the London County Council report that they have accepted an offer from the contractor for the erection of blocks Nos. 26 and 27 of the cottages on section A of the Tottenham Fields estate for the purchase of 167,000 bricks manufactured on the Norbury estate. The bricks will be used in the construction of the cottages, and the price offered is sufficient to cover the cost of production, inclusive of the cost of cartage from Norbury to the site.

The total number of bricks manufactured on the Norbury estate is about eleven millions, of which 1,980,000 have been used in the erection of cottages on section A. A further 1,012,000 are now required for fifty-two cottages on section B. The development of the Norbury estate has been retarded owing to difficulties which could not have been foreseen and over which the Council had no control, and the production of bricks has, therefore, exceeded the present needs of the estate. For this reason it was decided in June 1906 to discontinue temporarily the manufacture of stock bricks, and on July 31, 1906, the Council authorised the committee to dispose of the surplus bricks in the event of a favourable offer being received. One sale of 82,000 place and grizzle bricks has been completed, and an agreement has been entered into for the sale, at a price satisfactory to the Council, of two complete clamps of about 900,000 bricks. Several other offers have been received from builders in the neighbourhood, but they have not been accepted as the prices offered have been slightly below the market value.

The quality of the stock bricks recently manufactured is excellent. The tests which have been made of the various classes of building bricks show a high resistance to crushing power, and the results of the tests generally are quite satisfactory. As is the case on every brickfield, bricks of varying grades of quality have been produced, but only bricks which are satisfactory for building purposes are allowed to be used in the erection of cottages, the casing bricks and burn-overs being employed only for those operations for which they are suitable.

When the Norbury estate was purchased a brickfield occupied a portion of the site, and one of the conditions of sale was that the brickmaking plant should be taken over at a valuation. One section of the estate comprises a rising

mound of clay, a portion of which has to be removed before the estate can be properly developed, and when recommending the Council to acquire the estate the committee expressed the opinion that the brickmaking operations should be continued. The conversion of the surplus clay into bricks and burnt ballast obviates the necessity for its being dug and carted away from the estate at a cost which would not be less than 3s. 6d. a cubic yard.

THE CEMENT INDUSTRY.

THE United States Consul at Pretoria, in a report to the Washington Bureau of Manufactures, says that since the British occupation South Africa has presented one of the very best markets in the world for cement, because of the new life infused in the country through the public works departments of the various colonies, including harbour extensions, railway building, sanitary projects, cold storage concerns and the like. During the past few years the importations of the product have not fallen much below 200,000t.; in fact, 1903 records 500,000t. worth, while 1904 was but little behind that record. In 1903 America shipped to the Transvaal less than 80t. worth, and about double that amount the following year, while Germany's contribution during the same period was 68,375t. and 105,960t. respectively, England following with 43,545t. and 50,465t. Before 1898 the United Kingdom furnished the bulk of the cement imported, but with the subsidising of steamship lines and cheap rates to seaports in the Fatherland, Germany entered the South African field that year, and captured 16 per cent. of the total imports. Four years later Belgium and Denmark entered the lists, when the position of the principal competitors stood as follows:—United Kingdom, 43.4 per cent.; Germany, 37.2 per cent.; Belgium, 18 per cent. In 1903 Austria, France, Italy, Holland and Sweden captured part of the trade of Germany, but from that time the United Kingdom has been gradually increasing its hold, and advanced from 70 per cent. in 1904 to approximately 90 per cent. last year of the total imports, while Germany decreased nearly to its standing of 1898.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. Gill, town clerk, Town Hall, Birkenhead.

CASTLEFORD.—March 3.—The Governors of Castleford Secondary schools invite designs from architects practising in the West Riding of Yorkshire for a dual Secondary school, &c., for 300 scholars. Premiums of 50l. and 25l. to be awarded by Mr. W. H. Brierly, the assessor. Deposit 10s. 6d. Mr. A. Wilson, clerk to the Governors, Station Road, Castleford.

DUDLEY.—March 30.—For a free library in St. James's Road. Competitors must be practising within 50 miles of Dudley. Mr. H. C. Brettell, town clerk, Town Hall, Dudley.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20l. and 10l. will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

The general purposes committee of the Croydon Corporation presented a report at the meeting of the Council on Monday, in which was shown the result of an examination of the London County Council bricks at Norbury. The passage in the report was as follows:—"The borough engineer reported that the bricks used in the erection of the Norbury cottages of the London County Council were of good quality, suitable for the work and of the class usually used by builders of cottage property."

LEYTON LIBRARY.

BRIGHTON FRONT.

The following report from the Borough Surveyor of Brighton has been prepared for the works committee:—

In pursuance of your instructions, I beg to report to the committee the portion of the sea-wall on the Madeira Road. I understand the portion of the wall suggested to be commenced is that above the terrace, commencing at the New Steps and continuing eastwards to the eastern end of the Mound.

The wall, which was erected some seventy years since, is constructed of lime concrete, the face of which, with the action of time and weather, has in places become furrowed and indented. The wall, however, is in no danger, and will last for years without any heavy expenditure in the way of repairs, if the roughness referred to be not objected to. The concrete forming the wall having toned down with age, together with the brown tint of the shingle which has been exposed, in my opinion gives the old wall a somewhat pleasing appearance.

To prepare the face of the wall by dubbing out for and to compare with Portland cement the portion referred to will, I estimate, cost about 2,280*l*. I do not, however, consider it at the present time any more is necessary to be done in the filling up of the worst hollows, and this should be done in such a manner as not to give the wall a patched appearance. Further, I think the compoing of the wall would produce a very objectionable glare during the summer, and the action of the falling rain would doubtless in time

produce a series of streaks down the face. If the wall is re-faced it should be done in rough-cast, but the best effect would be caused by ivy or euonymus being trained up to the top.

The proposals have been referred to a sub-committee to consult with the borough surveyor and the superintendent of parks and gardens.

The Council of the University of Birmingham state in their annual report that during the year satisfactory progress has been made with the erection of the new buildings on the Bournbrook site and with their equipment. Blocks A, B and C have been completed, and the great hall and main entrance will be ready for use early in the ensuing summer. After numerous consultations with the architects the Council has approved of plans of additional buildings to be erected on the Bournbrook site fronting to University Road, to include the Harding Memorial library, the department of physics, the department of chemistry, and a central tower which will rise from the court to a height of about 325 feet. The foundations are already in progress.

GERMAN manufacturers of electro-motors have again decided to increase their prices by 10 per cent., thus making the total advance 25 per cent. in a single year. The step has been rendered necessary by the advance in the cost of certain raw materials, especially copper and brass. The German electrical engineering trade has, in spite of these advances in manufacturing costs, had a good year, if we may judge from the reports published by the Siemens-Schuckert group of companies, which show a distinct improvement over the previous year's workings in all cases. The firm of Siemens & Halske has a net profit of 7,964,000 marks (against 6,988,000 marks), and a dividend of 10 per cent. (against 9 per cent.) will be paid. The net profits of the Siemens-Schuckertwerke are 8,988,000 marks, which is about equal to 10 per cent. on the capital. The Electrical Works, formerly Schuckert & Co., report a profit of 3,204,134 marks (against 2,676,553 marks), and a dividend of 5 per cent. (against 4 per cent.) will be paid. It has been decided to raise the capital of this company from 42,000,000 marks to 50,000,000 marks.

TRUSSED CONCRETE STEEL CO.,
CAXTON HOUSE, WESTMINSTER.

LITHONITE.

WE lately called attention to the new application of asphalt in the form of sheets which is being introduced by Messrs. Engert & Rolfe, Ltd. A pamphlet has now been issued by them which explains by means of large-sized diagrams the method of laying lithonite under several conditions, both for flat and mansard roofs and for other purposes. A form of specification is also given which will facilitate operations. Lithonite complies with by-laws, and it is recognised as an excellent fire-resisting roof on account of the outer layer of sand and gravel or concrete. The manufacturers claim that it is sufficiently elastic to yield to any expansion or contraction in iron or concrete, settlement of building, warping of timber, vibration from heavy machinery, passing traction engines, trains, &c., without deterioration.

The system is simple and adapts itself readily to the most complicated ground plan. On account of the non-conducting properties of lithonite, the underside of the boarding upon which it is laid may be used as a ceiling, and dwelling-rooms arranged underneath. It deadens the sound of rain, hail, wind, &c., a fact which is of prime importance when the rooms immediately below are used for domestic or business purposes. Lithonite is absolutely impermeable to all atmospheric influences, dust, smoke, &c., and is not affected in the slightest degree by the extremes of heat and cold. Flat roofs are found to have so many advantages in some buildings their use is likely to be extended, owing to the existence of the light and economical covering which Messrs. Engert & Rolfe have produced.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have recently supplied some of their patent Manchester stoves with descending smoke flues to the hospital, Weston-super-Mare.

THE Ruberoid Company, Ltd., have introduced a protection for damp walls under the title of "Hercules Sheeting." This is made from first-class stock, impregnated with a waterproof compound. It contains no tar and will not deteriorate with age. It is applied to the wall by

means of Ruberoid solution, which in itself is an absolutely sure preventive of damp. It is claimed that this sheeting is not only waterproof but moistureproof, and that no damp or moisture can possibly pass it. It is supplied in rolls 36 inches wide containing 112 square yards. A sample yard will be sent on application.

A PARTICULARLY nice pen is that manufactured by Messrs John Heath & Co., of Birmingham, and known as The Postal Telegraph, 1880. It is a gold pen which will not easily corrode, has a broad point, and is well suited for a flowing handwriting. John Heath's pens can be obtained from any stationer.

WE are informed that Mr. Edmond Coignēt, through his licensees, Messrs. Peacock Brothers, of Brixton, has obtained the contract for the floors, posts and roofing of a new warehouse for Messrs. J. Grossmith, Sons & Co., wholesale perfumers, Newgate Street, E.C. The architect for the work is Mr. Henry A. Saul, A.R.I.B.A., of London. There will be altogether seven floors, calculated for a superload varying from $1\frac{1}{2}$ to 2 cwt. per square foot. The outer walls of the building and the foundations are to be made in brickwork. A noticeable feature will be the introduction of some large lintel beams. This building will be situated at the corner of Duke's Head Passage and Ivy Lane, Newgate Street, E.C.

MESSRS. THOMAS HENRY BAKER & EDWARD ERNEST MAY, architects, of 5 Headgate Court, Colchester, have dissolved partnership.

THE Archbishop of the West Indies, chairman of the local relief committee at Kingston, Jamaica, has sent to the Lord Mayor of London a synopsis of careful approximate reports made by experienced business men, from which he has deducted 15 per cent., which shows the total loss of buildings in the burnt area at 500,000l.; loss on private buildings in the city of Kingston and the suburbs which are in the parish of St. Andrew, 900,000l.; ecclesiastical buildings in Kingston, 60,000l.; Government and municipal buildings, 10,000l.; merchandise and personal property in burnt area, 500,000l.; ecclesiastical buildings out of Kingston, 30,000l.; other large buildings in other parishes, 20,000l.; total, 2,070,000l.

Awarded Diploma at Cheap Cottages Exhibition, Garden City, Letchworth.

SHOP FRONTS, INTERIOR FITTINGS, AND TRADE UTENSILS FOR BUTCHERS

Messrs. JESSE SMITH & CO., Family Butchers, Cirencester, write:—

GENTLEMEN,—Your contract for our new Pork Shop and Alterations to the Butcher's Shop having been completed for some months, we feel in justice to the Firm we ought to express our great satisfaction at the excellent manner in which everything has been carried out, considering we had to carry on a big business while the work was being done. Your workmen gave us so little trouble, and did their work in such a way, that it was not only creditable to themselves but also to their employers. We are perfectly satisfied with work done and quality supplied, and if at any future time we have any similar undertaking, we should most certainly consult Messrs. Parnall & Sons.

Yours very faithfully,

(Signed) JESSE SMITH & SON.

ELECTRIC NOTES.

electric supply committee of the Birmingham City Council had under consideration at their last meeting the report of a report to be presented to the Council. This report contains a recommendation that the committee should be authorised to borrow a further sum of 70,000*l.* or 100,000*l.* for various purposes, and principally for the laying of additional service mains.

The Islington Borough Council have been informed by London County Council that as they continue to refuse to the electrification of the tramways by the overhead system between Finsbury Park and Pentonville Road, Camden Road, the London County Council will apply to Board of Trade for approval of the overhead installation. They point out that this could be completed in half the time necessary for the installation of the conduit system and would effect a saving of 40,000*l.*

The Woolwich Borough Council began their ordinary meeting on Thursday, the 14th inst., at 7 P.M., and discussed several hours Sir Alexander Kennedy's report upon the Woolwich electricity undertaking, the management of which has been strongly condemned by Sir Alexander, who expressed the opinion that no profit could be looked for for years. The Council, which now has a Municipal Reform majority, decided to close the wiring department on March 31 and to sell the wiring stores which they have accumulated. It was stated that the loss on the electricity undertaking would be responsible for a rate of 5*d.* in the pound.

The electric-lighting committee of the Bath Corporation considered on Monday the report of the select committee in consultation with Mr. Schenck, who, on behalf of the Somerset and District Power Company, had made an offer for the Bath electrical undertaking. The committee unanimously resolved that the works be sold, and a special meeting of the City Council will be held on Tuesday next to confirm the decision. The concern has been a failure since the Corporation purchased it from a company in 1896. The shareholders will refund all the Corporation have spent (100,000*l.*) and pay 2,000*l.* original expenses, in addition to a bonus of 20,000*l.*, if the Board of Trade or Parliament will permit the undertaking to be sold in perpetuity. They anticipated an immediate reduction in the cost of lighting the

streets of 800*l.*, and there are other advantages. Including the release of capital, it is calculated that the sale will reduce the rates by at least 2½*d.* in the pound.

Mr. J. SNELL, consulting engineer to the London County Council, has issued a report on proposals which are before Dundee Town Council at the present time for extending their electrical undertaking:—(1) The extension of the existing station at a capital expenditure of 75,618*l.*; (2) a new station, with the use of the existing station in the winter months, at a capital expenditure of 93,000*l.*; and (3) a new station costing 119,633*l.*, abolishing the present station. Mr. Snell recommends the adoption of the second scheme, and he also advises the adoption of the high-tension system as more economical. His report says:—"On all points, therefore, and without exception, the case is clear for the adoption of high-pressure for all future transmission. To meet the future demands of the city from one station by low-pressure is, as I have already said, economically impossible; the three-phase high-tension system will be much more flexible, and enable any part of the city to be reached both now and, however reasonably extended, hereafter, and will permit of easy connection at minimum cost of even the most outlying factories. I therefore unhesitatingly recommend the adoption of the high-tension system." He further proposes that the Council should adopt a low, though financially sound, scale of charges, in order to encourage the demand for electrical energy.

THROUGH the liberality of the Misses Ward, Bottom Field House, Ossett, daughters of the late Alderman Joseph Ward, ex-mayor of Ossett, the Mayor and Corporation of Ossett have placed the order for new clock, chimes and bells with Messrs. Wm. Potts & Sons, of Leeds, the makers of Ossett parish church clock and chimes, Ossett railway station and Ossett co-operative stores clocks, as a memorial to their father. Messrs. Potts & Sons are also making a new illuminated clock, with four 6-foot dials and bell, for Messrs. Shaw & Shaw, Milnsbridge, Huddersfield. Both of the above clocks are in progress, and from the designs and plans of the late Lord Grimthorpe.

VARIETIES.

A NEW theatre is to be erected at Westcliff-on-Sea, Essex, from plans prepared by Messrs. Cabuche & Hayward, MM.S.A., of Westcliff.

A LARGE firm of chair manufacturers at High Wycombe state that since the preference of 33½ per cent. given to British goods by the Canadian tariff, their trade with Canada has increased with leaps and bounds.

THE Earl of Plymouth has presented Whitmore Bay, with its fine promenade and sands, to the Barry District Council. They intend to spend a considerable sum in making it one of the most attractive resorts in South Wales.

It has been decided to build a cotton-weaving shed at Pemberton, near Wigan, to hold 400 looms. A company called the Pemberton Manufacturing Company has been formed, with a capital of 20,000*l.*, and it is the intention of the promoters to begin building at once.

THE Johnstone Town Council have appointed Mr. M. Ratcliff Barnett to advise and report to the Council as to the best site for purification works, and the best system to adopt for the purification of the town's sewage in view of restrictory action by the Clyde Commissioners.

DURING a service at St. John's Church, Wolverhampton, a huge stone urn smashed through the roof and embedded itself in the floor of the church. The urn, weighing 4 cwt., had been part of the ornamentation of the spire 70 feet from the ground. No one was injured, though several persons had passed the spot only a few minutes previously.

AT Portsmouth on the 14th inst. Mr. Fred. James Willis, one of the inspectors of the Local Government Board, opened an inquiry with reference to the proposal that the Corporation should be empowered by a provisional order to charge the borough fund and rates as security for the sum of 70,000*l.* in connection with the municipalisation of the South Parade Pier, Southsea.

THE Baptist church at Consett, co. Durham, was opened on the 6th inst. It is designed in a late period of Gothic, faced with pressed red bricks with white dressings. The church, with tower and quaint spirelet and vestries, seating about 450 persons, has been erected by Messrs. J. Guthrie & Son, of Darlington, and Messrs. George Baines & Son,

5 Clement's Inn, Strand, London, W.C., are the architects. Schools are to be erected later.

THE Southampton Town Council have agreed to cede several acres of submerged land on the river Test shore to the South-Western Railway Company to enable them to carry out their dock extension scheme. In addition to the nominal monetary payment of 500*l.*, the company must undertake to reclaim a big stretch of mud land on the western shore by depositing spoil from the dock excavations thereon.

THE Aberdeen Harbour engineer has prepared for consideration of the Commissioners a report on improvement schemes which will have to be carried out during the next few years at a total cost of 556,380*l.* The docks and pilotage committee recommend the Board to proceed at once with the improvement of Provost Blaikie's Quay to provide deep-water berths and improved railway facilities at a cost of 30,000*l.*

AN extensive scheme of additions and alterations will be begun at the General Post Office, Edinburgh. At the Edinburgh Dean of Guild Court on the 14th inst. H.M. Commissioner of Public Works and Buildings was granted warrant for the removal of buildings and laying foundations for the proposed extensions, which, it is estimated, will cost at least 62,000*l.* and occupy over three years. It is expected that the extensions and alterations from the Low Calton side will be completed in eighteen months, when the work of adding the top storey will be begun.

A SYNDICATE is in negotiation with the Southport Corporation with a view to forming a lagoon on the south side of the marine lake. In the event of terms being arranged, the Corporation are to construct the sea-wall for the lagoon and roughly to make the island, for which work the estimate is 12,000*l.* On this expenditure a payment of 5 per cent. is offered to the Corporation, and the latter would in addition derive the benefit of the rating of the lagoon, the value of the advertising, besides the possible income from the supply of electricity. The Council are asked to give up control of the site for fifty years.

THE London, Brighton and South Coast Railway Company are maturing a scheme for extensive alterations to be carried out at the Eastbourne station at a cost of 50,000*l.*

FIRE-RISKS

first work to be undertaken will be the enclosing of railway premises on the Terminus Road side, the purpose being at some future time to extend the station over ground now appropriated as cab-ranks. The booking office, &c., will be reconstructed on the opposite side, and it is proposed to erect another platform alongside the northern one. A new engine-shed is required, and will be constructed in close proximity to the waterworks.

The *Pioneer Mail* (Allahabad) publishes information in Rangoon with reference to the Burma Oil Company's scheme for laying a pipe line from the oilfields to the railways. The length of the proposed new line is about 275 miles, and there will be four pumping stations en route. A pumping station will be in telegraphic communication with the oilfields. The transport of such a large amount of oil will entail considerable but not insurmountable difficulties. In view of the network of similar pipe lines in America and the experiments concluded by the Burma Oil Company, the success of their latest venture seems to be assured.

The Metropolitan Asylums Board at the meeting on the 15th inst. accepted the following tenders:—Messrs. J. Wrightson & Co., at the sum of 200*l.*, for the reconstruction of Gas House Bridge, Hoddesdon; Messrs. S. E. & Son, of Croydon, of 1,369*l.*, for the erection of an engine and boiler-house or chimney-shaft at Westerham; F. J. Minter, of Putney, of 3,186*l.* for the construction of an engine and producer-house, &c., at Selhurst; the Stanton Works Co., Ltd., of Nottingham, of 5,911*l.* 9*s.* 2*d.* for the supply of cast-iron pipes and other castings required in connection with the filter beds at Ditton.

A LOCAL GOVERNMENT BOARD inquiry was held on Tuesday at the Wallasey Council offices for the issue of a provisional order under section 303 of the Public Health Act, 1875, to partially repeal, alter or amend the Wallasey Improvement Act, 1872, so as to enable the Council to borrow 3,000*l.* for the erection of ferry workshops and 100*l.* for the purpose of deepening the approaches at the New Brighton ferry. The proposal to dredge at Egremont has for the present been dropped, and the present quotations represent the initial cost of dredging at New Brighton 7,700*l.*, altering the dredger *Tulip* 175*l.*, and new pump for same 600*l.*; total 8,475*l.*

THE new public baths which have been erected at Handsworth, at a cost to the ratepayers of about 23,000*l.*, were formally opened last week. The general building is situated in Grove Lane, at the corner of Hinstock Road, near the park. There are two swimming-baths. The Turkish bath consists of three hot rooms, shampooing-rooms, with needle bath and plunge, and a cooling-room. The whole of the baths are fitted throughout with electric light and electric bells, and are warmed by steam. The designs were prepared by Mr. J. P. Osborne.

THE Government have appointed a Royal Commission to inquire into the general sanitary condition of Belfast. The step has been taken as the result of representations made to the Irish Local Government Board by the Belfast Citizens' Association, which complained of the high death-rate due, it was alleged, to the unsatisfactory state of parts of the city. The Commission will consist of a number of gentlemen who have been or who are connected with municipal administration in England or Scotland as mayors, several prominent English medical officers of health and the chief inspector of the Irish Local Government Board.

A LOCAL GOVERNMENT BOARD inquiry was held at St. Ann's on the 18th inst. in respect of the application of the Council to borrow 3,500*l.* for the extension of the promenade from East Bank Road to Fairhaven Road. The surveyor gave details of the proposed extension, showing how it was proposed to preserve the sandhills as far as possible in their natural condition, to erect a sunken bandstand, provide shelters, a lake 1,320 square yards in area, crossed by a rustic bridge, and also to make a children's corner. The inspector, after going through the items, feared that the surveyor had underestimated the cost if the Council desired to make a first-class job of it. Even after allowing for the striking out of the lighthouse, which meant 150*l.*, he had only allowed 100*l.* for contingencies.

MR. J. R. CLYNES, M.P. for North-East Manchester, asked the Secretary of State for War on Tuesday whether he was aware of complaints made that Messrs. Arundle, builders and contractors, of Bradford, had not observed the rules and conditions of work and wages in the building trade in connection with military barracks works at Preston and Manchester, and whether this firm undertook to conform to any established provisions regarding work and wages.

Salford Ironworks, MANCHESTER.

Queen Anne's Chambers, Westminster, LONDON.

Mr. Buchanan replied that the contracts with Messrs. Arundle contained the usual fair wages clause providing for the payment of the standard rate of wages in the district. Special inquiries had been made with regard to the work of the Preston and Manchester barracks, and carried on by the firm, and it appeared that the provisions of their contract had been duly observed by them.

THE Coventry City Council have instructed Mr. Frederic Foster, of Coventry, to prepare a new set of sketch plans for a school on the Leicester Causeway site, to accommodate 1,200 children at a cost estimated at the rate of 13½ pence per head. Subject to the plans being approved by the Council and the Board of Education, and to the sanction of the Local Government Board being obtained to the necessary loan, the education committee were authorised to appoint Mr. Foster as architect for the work at a fee of 650l.

In a report to the Washington Bureau of Manufactures, Mr. E. A. Wakefield, the United States Consul at Orillia, says that an estimate of the quantity of timber which will be cut in the forests of the province during the winter of 1906-7 has been made by the officials of the department of lands, forests and mines, and it is believed that more lumber will be taken out this spring than was taken out last season. It is said that the lumbermen will fell 7,000,000,000 feet b.m. of pine this year, 70,000,000 feet b.m. of hemlock, 1,500,000 feet b.m. of spruce, 1,250,000 cubic feet of square timber, 100,000 cords of pulpwood and 4,500,000 railway ties. The activity in railway construction throughout the country has created a great demand for ties, and the production in Ontario will in consequence increase this year.

THE Department of Public Works, Ottawa, Canada, invite competitive plans for the new Departmental and Justice Buildings. The cost of the Justice Building is not to exceed 35 cents per cubic foot, and the cost of the Departmental Building 30 cents per cubic foot. The building is not to exceed five storeys in height above the basement, and the offices are to be set off in units suitable for subdivision. The Justice Building may be three or more storeys in height. Quarters are to be furnished for the Supreme and Exchequer Courts, Railway Commission and Department of Justice. Prizes will be awarded as fol-

lows:—Best design, 8,000 dols.; second, 4,000 dols.; third, 2,000 dols.; fourth, 1,000 dols. The competition closes on April 14.

MR. W. O. E. MEADE-KING, Local Government Board inspector, on the 14th inst. held an inquiry at the Guildhall, Lincoln, relative to the application of the City Council to borrow sums amounting to 11,082½ for purposes of the water undertaking. Mr. R. McK. Barron, the waterworks engineer, said the work in respect of which it was proposed to borrow the money comprised:—(1) New filter-beds, (2) alteration to existing filter-bed, (3) renewal of the aqueduct to Hartsholme Lake and the Ballast Pits, together with two new tanks and one low-level tank for all water tanked at the pumping station; also connections from the last-named tank to the engine. The waterworks engineer stated that the depth of the Boultham bore was now 2,035 feet, and had now reached the pebble beds, and the total depth was to be 2,200 feet. The capacity of the new tank was 45,000 gallons, and it would be all concretework. The contractor had claimed 2,000l. on the ground of interference with his work by that carried out by the Corporation on the same ground as the contract work.

LONDON COUNTY COUNCIL SCHOOLS.

THE report lately prepared on planning of schools by the education committee was published in this Journal. The proposals are that no classroom in the senior departments shall be planned to accommodate more than 40 scholars, and no classroom in the infants' departments more than 30 scholars. The reason for the proposed reduction in the number of scholars to be accommodated in each classroom under the proposed new system of planning is that the education committee are of opinion that 40 is the maximum number of senior children that should be taught at any one time by any teacher of average capacity. The finance committee, after consideration of the subject, say:—As to the number of teachers which the Council requires is practically governed by the total number of classrooms in the various schools, the increased cost of teaching involved in the proposals is determinable by the difference between the number of classrooms necessary under the present system of planning to accommodate a given number of scholars.

the number of classrooms which would be necessary under the proposed system. It has been calculated that the average increase under the proposed system in the number of rooms required to accommodate each 1,000 children is $3\frac{1}{2}$. As an additional room will be required for each extra room, the increase in expenditure, taking the average salary of a teacher (male) at 120*l.* a year, will be 450*l.* a year for each 1,000 children, or at the rate of 9*s.* a year for each child. As regards each child for salaries of teachers in all schools under the present system is estimated for the financial year 1907-8 at 3*l.* 12*s.* 4*d.* Applying these rates to the 28 new schools which it is proposed to erect in the next five years to provide aggregate accommodation for 14,600 children, the additional number of classrooms consequently of teachers would be 88, and the maximum additional expenditure in respect of the 28 schools for salaries of teachers would be 10,560*l.* a year. Any of the existing schools are planned on this principle but as it is possible that it may be extended in some cases to such of the existing schools as have large classes, the finance committee think it right to point out to the Council that the foregoing estimated additional expenditure applies only to the new schools in immediate contemplation, and that if the principle of smaller classes is applied to existing schools, the additional expenditure for teachers' salaries will of course be much larger than the above-mentioned sum.

OLD AND NEW LONDON BRIDGE.

The first of the present series of lectures at Carpenters' Hall, London Wall, was delivered on Thursday evening, 14th inst., by Mr. C. Welch, F.S.A., who took for his text "Old and New London Bridge," which was very ably dealt with and listened to with wrapt attention by the large audience that completely filled the magnificent hall. The lecture was illustrated by a considerable number of fine lantern photographs, and Mr. Welch, who was introduced by the Right Hon. Viscount Dillon, the chairman of the occasion, commenced by stating that of all the famous landmarks of which the City of London can boast, not one can boast of a more perceptive equal in interest, the world-famed

London Bridge. The old one, which was removed within living memory, existed for over 650 years, having been built in the reign of King Henry II., and lasted to the reign of King William IV.

The earliest London Bridge was a wooden structure, built soon after 993, partly destroyed by Olaf in 1008, and wholly destroyed by storm in 1091. It was then rebuilt by national contributions, largely consumed by fire in 1136, and finally rebuilt in stone in 1176. The havoc caused by war, flood and fire, disheartened the citizens from entrusting their safety any longer to a bridge of wood, and now a worthy priest arose who has richly deserved the gratitude of his own and each succeeding generation of Londoners. Peter of Colechurch, the founder, architect and liberal supporter of London Bridge, was a priest and chaplain or curate of St. Mary Colechurch, famous as the place where St. Thomas à Becket was baptized. The dedication of the bridge chapel to St. Thomas was a wise step in the interests of the bridge, and must have proved a great help in procuring the contributions of many devout and wealthy benefactors. Becket, who was murdered in 1170 and canonised in 1173, only three years before the foundation of the bridge, was enthusiastically adopted by the citizens as their patron saint, and on the reverse of the old City seal he is represented seated above London Bridge with a view of London and its walls below. The seal of the bridge, which bears the effigy of St. Thomas and a representation of his martyrdom, is preserved among the deeds relating to the bridge estates. To defray the charges of the new bridge of Peter of Colechurch, liberal contributors came forward, among them being Richard, Archbishop of Canterbury (Becket's successor) in 1174, and the worthy priest himself, besides designing and carrying out the entire work, is said to have built the chapel from crypt to roof at his own costs and charges. Henry II. also assisted the work by the imposition of a tax on wool, which gave rise to the popular tradition that London Bridge was built on wool-packs. In 1201, four years before the death of Peter of Colechurch, a letter was received by the mayor and citizens of London from King John, recommending Isenbert of Xaintes as a new architect to finish the work. The king's letter also provided that the rents and profits of the houses to be built on the bridge should be devoted to its repair and maintenance.

2965, 2967, 2969, 2971, 2973, 2975, 2977, 2979, 2981, 2983, 2985, 2987, 2989, 2991, 2993, 2995, 2997, 2999, 3001, 3003, 3005, 3007, 3009, 3011, 3013, 3015, 3017, 3019, 3021, 3023, 3025, 3027, 3029, 3031, 3033, 3035, 3037, 3039, 3041, 3043, 3045, 3047, 3049, 3051, 3053, 3055, 3057, 3059, 3061, 3063, 3065, 3067, 3069, 3071, 3073, 3075, 3077, 3079, 3081, 3083, 3085, 3087, 3089, 3091, 3093, 3095, 3097, 3099, 3101, 3103, 3105, 3107, 3109, 3111, 3113, 3115, 3117, 3119, 3121, 3123, 3125, 3127, 3129, 3131, 3133, 3135, 3137, 3139, 3141, 3143, 3145, 3147, 3149, 3151, 3153, 3155, 3157, 3159, 3161, 3163, 3165, 3167, 3169, 3171, 3173, 3175, 3177, 3179, 3181, 3183, 3185, 3187, 3189, 3191, 3193, 3195, 3197, 3199, 3201, 3203, 3205, 3207, 3209, 3211, 3213, 3215, 3217, 3219, 3221, 3223, 3225, 3227, 3229, 3231, 3233, 3235, 3237, 3239, 3241, 3243, 3245, 3247, 3249, 3251, 3253, 3255, 3257, 3259, 3261, 3263, 3265, 3267, 3269, 3271, 3273, 3275, 3277, 3279, 3281, 3283, 3285, 3287, 3289, 3291, 3293, 3295, 3297, 3299, 3301, 3303, 3305, 3307, 3309, 3311, 3313, 3315, 3317, 3319, 3321, 3323, 3325, 3327, 3329, 3331, 3333, 3335, 3337, 3339, 3341, 3343, 3345, 3347, 3349, 3351, 3353, 3355, 3357, 3359, 3361, 3363, 3365, 3367, 3369, 3371, 3373, 3375, 3377, 3379, 3381, 3383, 3385, 3387, 3389, 3391, 3393, 3395, 3397, 3399, 3401, 3403, 3405, 3407, 3409, 3411, 3413, 3415, 3417, 3419, 3421, 3423, 3425, 3427, 3429, 3431, 3433, 3435, 3437, 3439, 3441, 3443, 3445, 3447, 3449, 3451, 3453, 3455, 3457, 3459, 3461, 3463, 3465, 3467, 3469, 3471, 3473, 3475, 3477, 3479, 3481, 3483, 3485, 3487, 3489, 3491, 3493, 3495, 3497, 3499, 3501, 3503, 3505, 3507, 3509, 3511, 3513, 3515, 3517, 3519, 3521, 3523, 3525, 3527, 3529, 3531, 3533, 3535, 3537, 3539, 3541, 3543, 3545, 3547, 3549, 3551, 3553, 3555, 3557, 3559, 3561, 3563, 3565, 3567, 3569, 3571, 3573, 3575, 3577, 3579, 3581, 3583, 3585, 3587, 3589, 3591, 3593, 3595, 3597, 3599, 3601, 3603, 3605, 3607, 3609, 3611, 3613, 3615, 3617, 3619, 3621, 3623, 3625, 3627, 3629, 3631, 3633, 3635, 3637, 3639, 3641, 3643, 3645, 3647, 3649, 3651, 3653, 3655, 3657, 3659, 3661

King John contributed in 1213 to the repair of London Bridge by appropriating to its use the "God's pence" taken of foreign merchants. In 1212, not long after the erection of the houses on the bridge, which were intended as a means of its support, they were swept away by a disastrous fire, which even threatened the destruction of the bridge itself, and threw a further burden upon its revenues.

The bridge took thirty-three years in building. It consisted of a stone platform, erected somewhat westward of the former wooden bridge, and was 926 feet long and 40 feet in width, standing about 60 feet above the level of the water. It contained a drawbridge and nineteen broad pointed arches, with massive piers varying from 25 feet to 34 feet in breadth raised upon strong elm piles covered by thick planks bolted together. It is possible that the immense wooden starlings attached to the piers did not form part of the original structure, but were added afterwards to keep the foundations of the bridge from being undermined. The obstruction caused by these huge barriers and the large number of piers reduced the entire channel of the river from its normal breadth of 900 feet to a total waterway of 194 feet, or less than a fourth of the whole. Peter of Colechurch's work has, however, not been without defenders (even as regards these points) among architects in more recent times, who have urged that the narrowness of the arches tended to preserve the navigation of the river above the bridge.

Between the sixth and seventh piers, counting from the southern end, an aperture allowed the passage of large high-masted vessels. The opening was crossed by a wooden bascule, which was raised to admit ships or to prevent the inroad of a hostile force upon the bridge. This drawbridge was from the first a source of great trouble, being constantly in need of repair or rebuilding. The bridge gate which guarded the entrance to the City from the south stood over the first arches of the Surrey end. "This gate," Stow informs us, "with the tower thereupon and two arches of the bridge, fell down, and no man perished by the fall thereof, in the year 1436, towards the new building whereof divers charitable citizens gave large sums of money." In 1471 the Bastard Falconbridge and his Kentish mariners assaulted this restored entrance gate and burned both it and thirteen houses on the bridge.

Norden's view shows the traitors' heads fixed over the gate. This first happened in 1577, when the stone tower which they were previously placed was removed. A great fire in 1725 destroyed many houses at the Southwark end of the bridge, and severely damaged the gate, which had then formed a very inconvenient approach to the City, as it was only 13 feet wide. After this fire the gate was reconstructed, the roadway widened to 18 feet, and two posterns added for foot passengers. This was completed in 1728 and duly recorded in an inscription placed above the gate. Not long afterwards, in 1731, it was demolished with the rest of the City gate. The next important structure was the strong tower known as the Great or Stone Gate. Upon its battlements the heads of traitors were at first placed, and it formed a second line of defence from invaders attacking the City from the south. In 1426 the tower adjoining the drawbridge was rebuilt. On the removal of the tower in 1577 a new structure, consisting of a gate and a tower, was set up on its site, and this was finished in 1577. It was a beautiful building having all its fabric above the bridge formed of timber. But the glory of the gate of 1577 was quite outshone by the magnificence of a wooden palace which spanned the bridge on the City side of the chapel, and was proudly called Nonsuch House. It is said to have been constructed in Holland entirely of wood and brought over in pieces, being erected on the bridge with wooden pegs only, not a single nail being used in the whole fabric. Built on the seventh and eighth arches of London Bridge from the Southwark end, it overhung the parapet on either side, leaving a clear passage 20 feet wide underneath the structure in the centre. This magnificent building was crowned with carved gables, cupolas and gilded vanes, and two sun-dials were placed on the top of its southern side. The date of its erection cannot be fixed with certainty, and its building and decoration probably occupied many years. The celebrated mansion was repaired in 1632, the entry of that year specifying it by the name of "Nonsuch." In the same year, and in 1649, the workmen were busy rebuilding the houses which had lain in ruins since the fire of 1632. Even then the gaps were not completely filled, and to that circumstance was probably owing the

that the Great Fire of 1666 did not inflict much damage on the bridge thoroughfare. Among the celebrated persons who resided on London Bridge is said to have been John Wren, and it is a well-established fact that Hans Holbein, Court painter, lived on the bridge, as did also Peter Willems and Dominic Serres, marine painters, and Laguerre, engraver.

The singular picturesqueness and animation were lent to the bridge by the houses which lined its thoroughfare, though they seriously interfered with the comfort and the safety of passengers. These houses were first built in the reign of John, not long after the death of Peter Colechurch, in 1205, the object being to provide a reliable source of revenue for the bridge. The London tradesmen recognised the excellent trading possibilities of the bridge thoroughfare, and next to the famous Goldsmiths' in West Chepe, it became the most coveted business in the old City. In a rental of the year 1358 the number of shops on the bridge is 138, and the amount of rents 160*l.* 4*s.* Next in interest to the bridge itself is the chapel dedicated to St. Thomas of Canterbury, familiarly called St. Thomas of the Bridge. This was erected on the tenth or centre pier, which measured 35 feet in breadth and 115 feet from point to point. The building was 60 feet in length by 20 feet broad, stood over the parapet on the eastern side of the bridge. The chapel was built by Peter of Colechurch, and formed the nucleus of his design for the erection of the bridge. His remains were buried under the staircase in the middle of the building, which was the most beautiful on the bridge, either brass plate nor any inscription marked the site of his tomb. In 1549 "it is agreed," runs a City minute, "that Mr. Wylford and Mr. Judde, surveyours of the workes of the brydges, shall to-morrowe begyn to cause the chapel of the same brydge to be defaced, and to be translated into a dwelling-house, with as moche speede as they conveniently maye." For a year or two, nevertheless, the aged remnant of the once beautiful edifice lingered on, and in 1553 the agents of destruction appeared on the scene. The centre of administration of the affairs of the bridge was the Bridge House. This house, in Stow's opinion, is said to have beginning with the first founding of the

bridge, either of stone or timber." It had two frontages, one on the river and the other at Tooley Street, then known as Barns Street. It occupied with its wharves and storehouses a great space of ground, and lay east of St. Olave's Church, and separated from it by a great stone house belonging to the Abbot of St. Augustine of Canterbury. The house served not only as the headquarters of the workmen at the bridge, but also as an office for the wardens, and was accordingly provided with a well-appointed suite of apartments for purposes of official business and entertainment.

The history of London Bridge during the eighteenth century chiefly consists of doubts whether the bridge would stand, surveys of its buildings, repairs, reports of architects, schemes for its alteration, and controversies concerning the erection of a new bridge, and, notwithstanding the expenditure of 100,000*l.* on the reconstruction about forty years previously, the nineteenth century opened with renewed agitation for better bridge accommodation. Designs for a new bridge were obtained, and finally in July 1823 an Act was passed "for rebuilding London Bridge, and for improving and making suitable approaches thereto." The design of John Rennie was adopted, and the contract was given to Messrs. Jolliffe & Banks, who undertook to construct the bridge within six years, about 100 feet to the westward of the old bridge, for the sum of 426,000*l.* The old bridge was to remain until the new one was completed. The first pile was driven on March 15, 1824, and the new London Bridge was opened by King William IV. and Queen Adelaide on August 1, 1831. The old bridge was not entirely removed until 1832, when the bones of the builder, Peter of Colechurch, were found beneath the masonry of the chapel.

The bridge, as all know, has quite recently been widened, and this has furnished a sensible relief to its ever-increasing traffic. For more than 760 years no second bridge spanned the river within the limits of the Metropolis, for it was not till the middle of the eighteenth century that Westminster and Blackfriars bridges were built. But the old approach to the City still attracts thronging crowds of passengers, and London Bridge to-day, with its myriads of travellers, is still one of the greatest sights of the world.

A hearty vote of thanks was accorded to Mr. Welch for his instructive lecture, of which we have given but a brief résumé.

INDUSTRIAL ART.

THE prizes obtained by students of the Municipal School of Art, Birmingham, were distributed last week by Mr. George Clausen, A.R.A., who delivered the customary address. He pointed out that formerly all instruction was of a workshop character, but with the exception of sculpture that kind of instruction had died out, and the very meaning of the word "art" had become so hazy that instead of it comprising the whole manufacture of any beautiful thing it was now restricted to a kind of embellishment or ornament. In the old days of the workshop there was very little talk about art, but now there was a great deal. Art was in danger of becoming a pleasing excrescence, not something vital and useful, but sometimes regarded even as a thing which might be plastered over some one else's work to make it beautiful. One could not too strongly insist on the fact that the first element of beauty was that of fitness, whether in painting, sculpture, the making of furniture, the erection of buildings or the production of anything else. People had been making beautiful things since the beginning of the world in obedience to a want for those things. Beautiful things had been made because they were useful.

Birmingham was to be congratulated on possessing a school which was solving most successfully the difficult problem of joining theory with practice. He had that day been through their schools and had seen their work, and its excellence was remarkable. The examples of work—not paper models, but actual things designed and made—were, it seemed to him, in some cases as fine as it was possible to make them. He was particularly struck with the metal-work and jewellery, with the writing, the needlework and bookbinding, the best works in which were as fine as the examples of old times treasured in our museums. There was in them that union of the heart and hand found in all true art. These objects of daily use made beautiful should command from all who loved art ready appreciation. If he had to give a wedding present there was nothing he should like better than to choose some of the many things which he had admired at their exhibition. These things should be sought and treasured like a fine picture or a statue. He

thought it was a very healthy sign for the artistic life of a country that the energy of so many students should be devoted to this work of making beautiful things which people were likely to want. Unfortunately he had to see a great many pictures which probably no one would ever want and it seemed to him so much better that artistic energy should be turned into necessary and useful channels and be allowed to wander over the vague field of picture making.

All work should be vital. What made so much of what was called ornamental work a thing to be avoided was that it was matter in the wrong place. If a thing fulfilled its purpose without a line of adornment it was at least ugly, and might be even beautiful in proportion. Decoration should grow naturally from it and should be thought, have some meaning, or at least some relation to beautiful things. Nothing was new. People had been making houses, statues, pictures and furniture from the earliest times, and therefore it was very necessary for them to study precedent. This was the advantage of the museum. Too often a student started designing an object as if he felt himself to be the first one who had ever made such a thing to do, but if they studied the history of things made in obedience to the same needs as their own, they could learn a great deal. They should study, always having in mind the child's questions "how" and "why." Then, if they had the sense they might do something original. A childish attitude of mind was a most necessary thing for an artist to keep as long as ever he could. There was in Birmingham a distinct school of painters, founded largely on the pre-Raphaelites and also partly on the work of Burne-Jones. The Birmingham school was the one school they had still working on those traditions, and he wondered whether it would be possible to develop this school in the way others had been developed by entrusting the decoration of some of the Birmingham buildings to able young artists whom they had trained. The competition for the decoration of the Houses of Parliament which took place in the middle forties marked a distinct epoch, a time of awakening in English art, and it was possible they might do a similar thing in Birmingham. They would then not only find a use for their local artists, but would also add to the glory of their city.

**6-11 IMPERIAL BUILDINGS,
LUDGATE CIRCUS, LONDON, E.C.**

Dear Sir,—We beg to call your attention to the above paper, which appeals directly to a large section of the public. It is practically a new paper—grafted on two old-established periodicals with which it is now incorporated and gives a full reflection of the building industries. Its pages contain information useful to all; it should be carefully studied from end to end.

Issued to meet the trend of the times at a popular price, it contains as much of everything interesting to be engaged in building operations as any of the higher priced papers.

It is not too much to say for ourselves, and we state it with every confidence, that a year's subscription to "THE BUILDING TRADE" is one of the best investments anyone connected with the industry can make.

We trust we may have your assistance in making our new venture a great success, and shall be glad if you will fill up the accompanying Order Form and forward it as soon as possible.

Faithfully yours,

GILBERT WOOD & CO., Ltd.

P. A. GILBERT WOOD, Managing Director.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. Gill, town clerk, Town Hall, Birkenhead.

CASTLEFORD.—March 3.—The Governors of Castleford Secondary schools invite designs from architects practising in the West Riding of Yorkshire for a dual Secondary school, &c., for 300 scholars. Premiums of 50l. and 25l. to be awarded by Mr. W. H. Brierly, the assessor. Deposit 10s. 6d. Mr. A. Wilson, clerk to the Governors, Station Road, Castleford.

DUDLEY.—March 30.—For a free library in St. James's Road. Competitors must be practising within 50 miles of Dudley. Mr. H. C. Brettell, town clerk, Town Hall, Dudley.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20l. and 10l. will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

FAILSWORTH.—March 28.—The District Council invite designs for a library (cost not to exceed 3,000l.) in Oldham Road. Premiums of 20l. and 10l. Deposit one guinea. Mr. H. C. Broome, clerk, Council Offices, Failsworth.

SUNDERLAND.—March 30.—New church and halls for the Presbyterian Church of England in the Side Cliff Road, Roker, Sunderland. Premiums of 25l. and 15l. respectively. Lithographed plans of site, &c., on application to Mr. George W. Bain, 46 John Street, Sunderland.

WIMBLEDON.—March 9.—For an elementary school in Pelham Road to accommodate 1,000 children. Premiums of 150l. (to merge in the commission) for the first design, and of 100l. and 50l. Mr. J. W. Simpson, assessor. Send in name with qualifications to Mr. A. Steele Sheldon, clerk, Education Office, 12 Queen's Road, Wimbledon.

PRICE LIST ON APPLICATION.

"BRIGHTSIDE
IMPROVED" PATENT
CALORIFIER.

CONTRACTS OPEN.

ADLINGTON.—March 5.—For the erection of an elementary Council school at Adlington, Cheshire, to accommodate about 180 children. Deposit 2*l*. Mr. Arthur Brocklehurst, architect, Adelphi Chambers, 30 Brown Street, Manchester.

ALNWICK.—March 2.—For proposed alterations and additions to Messrs. Barclay & Co.'s branch bank. Messrs. Hicks & Charlewood, architects, 67 Westgate Road, Newcastle-on-Tyne.

ARMATHWAITE.—March 2.—For the erection of a stone bridge of four arches across the river Eden, in the parishes of Ainstable and Hesket-in-the-Forest, within half a mile of Armathwaite station, Cumberland. Deposit 1*l* 1*s*. Mr. Geo. Jos. Bell, M.I.C.E., county surveyor and bridge-master for Cumberland, The Courts, Carlisle.

BARNET.—March 13.—For the erection of nurses' home at the workhouse at Barnet. Messrs. White, Son & Pill, 13 and 15 High Street, Barnet.

BARNLEY.—March 5.—For additions to the Cooper nurses' home, Beckett hospital. Messrs. R. & W. Dixon, architects, 5 Eastgate, Barnsley.

BARROW-IN-FURNESS.—March 12.—For the erection of a balcony at the North Lonsdale hospital. Deposit 10*s* 6*d*. Mr. E. F. Norris, 9 Coniston Road.

BOTTALLACK.—March 2.—For the erection of a pair of residences at Bottallack Mine, St. Just, Cornwall. Mr. Oliver Caldwell, architect, Victoria Square, Penzance.

BOURNBROOK.—March 20.—For a tower 300 feet high at the new university buildings at Bournbrook, Birmingham. Deposit 2*l* 2*s*. Sir Aston Webb, R.A., and Mr. E. Ingress Bell, architects, 19 Queen Anne's Gate, London, S.W.

BURNTWOOD.—March 2.—For alterations and improvements to the Burntwood and Chase Terrace Council schools, Staffordshire. Deposit 1*l* 1*s*. Mr. Graham Balfour, director of education, County Education Office, Stafford.

COVENTRY.—March 9.—For the erection of eight labourers' cottages and additions to farm buildings at the Corporation sewage farm, Baginton, near Coventry. Deposit 1*l* 1*s*. Mr. J. E. Swindlehurst, city engineer and surveyor, St. Mary's Hall, Coventry.

DONCASTER.—March 7.—For the erection of retort-house and coal-store extension with iron tussed roofs at the gasworks, viz. (a) retort-house and coal-stores buildings, (b) retort-ironwork for same, (c) the whole of the buildings completed by Mr. R. Watson, engineer, Gasworks, Doncaster.

ENFIELD.—March 11.—For extending each end of two of the pavilions at the isolation hospital, World's End, Winchmore Hill. Mr. Richard Collins, Public Office, Enfield.

GILDERSOME.—March 4.—For the erection of a stable block at the Surveyor, Council Offices, York.

HASLINGDEN.—March 13.—For the demolition of four cottages, widening of the Ogden river bridge, the erection of parapet walls and other appurtenant works in connection with the said bridge, at Helmsore. Deposit 1*l* 1*s*. Office of Mr. J. Singleton Green, borough surveyor, Haslingden.

YELLING.—March 5.—For works of addition and alteration to the Council school. The County Education Committee, 36 High Street, Huntingdon.

THE negotiations between the London County Council and the Chancellor of the Duchy of Lancaster with regard to the extension of the Kingsway subway to the Embankment, which have delayed the work of construction, have been concluded. By an Act of 1902 the Council was empowered to carry the subway to the Embankment, but not to construct tramways on it, and 5,400*l.* was agreed upon as the compensation payable to the Duchy as owner of the estate. A further 4,000*l.* has now been claimed in view of the construction of tramways, and the sum of 9,400*l.* has finally been fixed upon by the highways committee, subject to approval by the Council, to cover all damage other than structural to the property of the Duchy.

SUMMER DRIED SEASONED BATH STONE FOR WINTER USE.

ELECTRIC NOTES.

THE Municipal Council of Sofia have approved in principle a petition addressed to them by M. St. Athanasoff, engineer, asking authority for the establishment in the city of a new electric installation and of a new electric tramway system.

THE Edinburgh Corporation electric-lighting committee have recommended the acceptance of estimates amounting to upwards of 10,000*l.* for new condensing plant at M'Donald Road electric station and 130,000*l.* for generators. The new plant, it is expected, will meet the demand of the department for two winters, and, while abating the nuisance complained of in this part of the city, will increase the output of the station.

MR. J. J. WALKLATE, the general manager of the Potteries Electric Traction Company, Ltd., has been appointed general manager of the Auckland Tramways Company, Ltd., New Zealand. Mr. Walklate was associated with the earliest development of overhead electric traction, having assisted in the electrification of a section of the South Staffordshire tramways under Mr. Alfred Dickinson. This was the first experiment of the trolley system in this country.

THE *Levant Herald* reports that the Turkish Government have prolonged the concession of the Société des Tramways de Constantinople until the year 1993, and the company have undertaken to substitute electric for animal traction, and to construct within five years three new lines:—(1) To Pera, from the Galata-Serai Tunnel; (2) from Pancaldi to Tattavla; (3) to Stamboul from the Mosque of Fatih. They have also undertaken to double the present line from Galata to Ortakeuy.

A DISPUTE has arisen between the parish council of Edinburgh and the electric-lighting committee of the Corporation of the city concerning the rating of the electric-lighting undertaking. The committee demanded a deduction of 47½ per cent. on the assessed rental and the Council offered 24 per cent. The committee offered to accept a deduction of 35 per cent., being the same as for railways, or to submit the dispute to arbitration. The parish council authorities, however, have intimated that they adhere to their demand for payment as imposed, and that unless it is

made within twenty-one days proceedings will be taken for recovery of the amount.

THE Norwich Town Council have approved the report of the electricity committee which stated that the estimated amount required for the purpose of the undertaking to December 31, 1908, for mains, services, meters, engine and dynamo, two boilers and steam-pipe mechanical stokers, feed pumps and feeder booster is 25,000*l.* They also recommended that application be made to the Local Government Board for sanction to borrow 25,000*l.*, being the estimated sum required for capital expenditure to December 31, 1908.

WITH regard to the power and scenic conditions at Niagara Falls, United States, Secretary Taft is reported to have granted the Canadian Niagara Power Company a permit to transmit 52,500 horse-power; the Ontario Power Company a permit to transmit 60,000 horse-power; the Electrical Development Company to transmit 46,000 horse-power and the International Railway Company to transmit 1,500 horse-power from Canada to the United States. The Niagara Falls Hydraulic Power and Manufacturing Company also receives permission to divert about 2,000 additional cubic feet of water per second for the new power plant it is building to supply the new works of the Pittsburgh Reduction Company.

THE electric-supply committee of Birmingham report to the City Council that in 1904 the Local Government Board sanctioned a loan of 373,568*l.*, in which was included a sum of 65,000*l.* for lighting mains, and in July, 1905, a further 16,000*l.* was sanctioned for lighting cables, feeders, &c., for opening up the Saltley district. Since that time the growth of the department has necessitated considerable extensions of mains, chiefly in the Summer Lane, Balsall Heath and Bordesley districts. Expenditure that has already been necessary to meet applications from consumers has amounted to a sum of 7,378*l.* over the loans authorised. The engineer estimates that for the next three years the expenditure on mains will amount to about 70,000*l.* The committee therefore recommend that the Local Government Board be asked to sanction a further loan of 80,000*l.* for these purposes.

REFINEMENT IN WALL HANGINGS.

We had an opportunity recently of inspecting Messrs. Jeffrey & Co.'s new stock of wall-hangings, and we were greatly pleased with the variety in designs, colour schemes and prices displayed, such variety being of importance to any firm desirous of gratifying the catholic views of the public, whose taste, we may regret, too often favours bright and crude colours. We look forward hopefully to the time when wall-paper manufacturers will altogether lead instead of having to follow partially the public taste. Messrs. Jeffrey & Co. endeavour—and successfully—to minimise the defect, and when we observe designs by such artists as Messrs. Neatby, Heywood Sumner, Walter Crane, Lewis Day, &c., it is evident that the public is given ample scope for educating its taste. The firm uses a specially prepared canvas paper for the hand-printed goods, and the colouring is guaranteed to be fast; furthermore, the public is assured that arsenic does not enter into the preparation of any of Messrs. Jeffrey & Co.'s productions. It is of interest to note the possibilities in varying the interspacing of the "stripes" in designs, where this style of decoration is either partially or wholly employed. We would also call attention to the combined frieze and filling papers, as alleviating what is at present of too frequent occurrence, that is, the lack of continuity—of unity between the designs of the body and the upper portions of the walls. We observed some handsome flock papers, the designs of which are excellent. Messrs. Jeffrey & Co., whose warehouses are at Essex Road, Islington, have now conveniently situated show-rooms in Mortimer Street, W., where architects can conveniently inspect their productions. In conclusion, we would draw special attention to the handsome "Chesterfield" design, to one adapted from a damask in the Palazzo Marghera at Rome, and finally to a treatment of peacocks in embossed leather, one of Mr. Walter Crane's designs,

which took our special fancy, unmindful of the expenditure attendant upon its selection, for it costs a trifle of 18*l.* a piece; and though informed that the same design more plainly treated can be obtained for 2*s.* a yard, we have no desire to modify our preference for the more costly treatment in colours and gold.

TRADE NOTES.

THE new infirmary for Whiston Union, near Prescot, is ventilated throughout by Messrs. Arnold W. Kershaw & Co., Lancaster. Other recent contracts include Morrison schools, Liverpool; No. 2 Ring Spinning Mill, Stockport, &c.

MESSRS. JOHN OAKEY & SONS, LTD., have been able to declare a dividend of 10 per cent. for the year, and in addition a bonus of 5 per cent., free from income tax. So satisfactory a result is a testimony to able management.

LIVING screens for lawns appears an attractive feature as advertised in our "Miscellaneous" column. Many a public garden might be improved at a low cost, and as these screens are specially prepared and are supplied at such a reasonable rate there should be no difficulty in making some of our open spaces more attractive.

THE London and Lancashire Fire Insurance Company have made arrangements for the provisions required under the extension of the Workmen's Compensation Act, by which not only workmen in the usual acceptance of the word, but domestic servants, gardeners, coachmen, grooms, shop assistants, clerks, typists, &c., are entitled to compensation for accidental injuries. The rates are low, and the insurers have the advantage of the security of an established company with a capital of 2,280,000*l.*

THE West Riding rivers board at Wakefield have decided to institute legal proceedings against the Leeds Corporation for offences under Section 7 of the West Riding of Yorkshire Rivers Act, 1894. It will be remembered that the ratepayers of Leeds recently rejected on a poll the sewage scheme of the city Corporation, involving an expenditure of about a million and a quarter pound's sterling.

VARIETIES.

THE Merchants' House, Glasgow, is to be enlarged and otherwise altered from plans by Messrs. John Burnet & Son.

BUILDINGS for the Kirkintilloch gasworks are to be erected at a cost of 20,000*l.* from plans by the manager, Mr. William Wilson.

THE Dublin County Council have passed a resolution for providing 400 labourers' cottages without delay in the districts of Blanchardstown, Castleknock, Coolock, Drumcondra (Rural), Glasnevin (Rural), Finglas and Howth.

THE new premises on the sites of Nos. 158, 160 and 162 Oxford Street, for Messrs. Mappin & Webb, Ltd., are to be completed within eighteen months. Mr. Belcher, A.R.A., is the architect.

THE Duke of Norfolk has offered to provide a shelter to accommodate 500 people on the common at Littlehampton. It will have four shops. Probably the Town Council will suggest additions to the structure.

PLANS are being prepared for a new home for the Birmingham District Nursing Society. The cost is estimated at about 4,000*l.* A site has been selected in Summer Hill Road, comprising 1,000 square yards.

THE Scarborough harbour commissioners at their half-yearly meeting adopted the scheme for improving the harbour accommodation. Estimates of the cost were submitted as follows:—For widening the west pier, 7,460*l.*; deepening the old harbour, 3,850*l.*; deepening the east harbour, 2,950*l.*—total, 14,260*l.*

ON Monday in the House of Commons a Bill was presented and read for the first time to apply the provisions of the Life Assurance Companies Acts, 1870 to 1872, to companies carrying on the business of insuring employers against liability to pay compensation or damages to workmen in their employment.

THE Duchess of Roxburghe, in view of the contemplated visit of the Prince and Princess of Wales to Floors Castle, is said to be spending 125,000*l.* in the necessary preparations. Improvements and additions of a most extensive description are about to be carried out at the Castle for the purpose of still further beautifying it.

THE construction of a canal from Buenos Ayres to La Plata is under contemplation. The cost of construction of such a work is put down at 5,250,000*l.* The cost of maintenance is estimated at about 337,000*l.* per annum and revenue at about 360,000*l.*, leaving a probable net revenue of 23,000*l.*

THE Hammersmith Borough Council have decided, provided the County Council contribute a fair proportion of the cost, to open up, at an estimated cost of 22,300*l.*, communication between North Kensington and Shepherd's Bush by the construction of a new street from Wood Lane to Latimer Road and leading under the West London Railway.

THE Dumfries Dean of Guild Court have passed plan for a new building for St. Joseph's Commercial College. It is to be erected in the grounds of Mount St. Michael, where there is also a novitiate of the Marist Brothers, and will provide both residence and classrooms for pupils. The cost is estimated to be about 10,000*l.*

A REPORT prepared by Mr. Lister Woodhouse, comptroller to the city of Westminster, shows that on vacant land in the city nearly 40,000*l.* has been lost to the rate owing to the demolition of property for London County Council improvements, chiefly those at Millbank, Holborn Strand, and Clare Market.

THE Ramsbury Rural District Council recently had before them the selected applicants for the post of surveyor and inspector. Originally there were eighty-four, from whom a selection of four was made. The committee resolved to appoint Mr. W. Strickland, of Bristol. The salary is 65*l.* per annum for each office, rising by 5*l.* instalment to 150*l.*

THE Home Secretary, speaking in the House of Commons on Tuesday, said he regretted it was the case that there had been five fatal accidents in the Carnarvonshire slate quarries since the beginning of the year, four of them being due to falls of rock. During the whole of 1906, however, there was only one fatal accident in these quarries, and in each of the years previous to that only three. There seemed no reason to suppose that the increase was other than temporary, but the inspector was making further inquiry. He thought it might be partly attributable to the long and severe frost making the rock more dangerous.

VOLUME LXXXVI. OF THE ARCHITECT
Handsome bound in Cloth Gilt Lettered, price 12s.
6-11 Imperial Buildings, Ludgate Circus, E.C.

Mr. ASQUITH, the Chancellor of the Exchequer, stated in the House of Commons on Monday that there was no necessity to appoint a body of experts to consider the desirability of the construction of a tunnel under the English Channel from the point of view of national welfare and security, as the Government is officially informed on the subject by the Committee of Imperial Defence and other professional advisers.

THE list of applications to be made at the adjourned Birmingham city licensing meeting on March 7 includes one for music, singing and dancing license for a new concert hall to be erected by Mr. Walter de Freece, in New Street on land adjoining the Theatre Royal. If the license is granted a well-appointed building, with imposing façade of terra-cotta to New Street, will be erected. The hall, which will run back a considerable distance, will provide a very large auditorium, somewhat after the style of the Empire.

THE Coventry City Council have approved recommendations from the general works committee that the Council purchase two pieces of land, with property standing thereon, at Bishopsgate Green, as a site for a refuse destructor, the total area of land being 11,751 square yards, and the total purchase price 2,920*l.*, as also that the committee be authorised to proceed with the preparation of plans and specifications for the erection of a refuse destructor and depot on the site.

A GATHERING recently took place at the Plough Hotel, Tenhousemuir, of the staff of the Carron Company, including the manager, assistant manager, heads of departments, and all the various foremen employed at Carron and Mungall foundries, engineering works, the several milleries, and Grangemouth and Bo'ness shipping staffs, under the chairmanship of the manager (Mr. Bamforth), supported by Mr. J. J. Maclaren, the chairman of the company, Mr. F. L. Burder and Mr. A. Mitchell-Dawson. The programme of toasts was unique, comprising only "The King, Queen and Royal Family" from the chair, and "Carron Company," proposed by Mr. Peter Rae, one of the oldest foremen in the employment. A musical programme was provided by several artistes from Glasgow, which gave great satisfaction. All the arrangements were

made and carried out most successfully by a small committee, and the evening's entertainment will be long remembered by every one present.

A SPECIAL meeting of the Scottish Building Trade Federation was held on the 22nd ult. in the Building Trades' Exchange, Edinburgh, to consider the proposed amendment on building regulations as to scaffolding, &c. It was decided to communicate with the Home Secretary stating that the meeting had agreed to appoint witnesses from the principal centres of Scotland—namely, Edinburgh, Glasgow, Dundee, Aberdeen and Inverness—to lay expert evidence before the departmental committee in London, as the proposed rules were not at all applicable to Scotland.

A CONFERENCE between a deputation representing the Building Trades' Operatives Federation and the contractors and some of the sub-contractors who are building the new Manchester Royal Infirmary was held on the 21st ult. The question in dispute was discussed, and in the end an amicable understanding was arrived at, the employers promising to recognise the regulations of the various trades in operation in this district. On behalf of the men it was denied that there was any grievance, as had been reported, in the fact that a Doncaster and not a Manchester firm had secured the contract. Under the arrangement the men who were out would resume work on the following day, and the dispute is therefore at an end.

As a result of investigation which has been made by the Colney Hatch asylum sub-committee, it appears that men employed in the plumbers' shop at that asylum have been making away with old lead recovered in the course of alterations to existing buildings, which should have been used for other work. A considerable quantity of metal must have been stolen and the thefts have evidently gone on for some months. There is no doubt as to the guilt of the men concerned, although there is not sufficient corroborative evidence to secure a conviction in the event of a prosecution. One plumber and two plumbers' labourers have been dismissed, and the resignation of the foreman plumber has been called for and received. Other employés, who evidently knew of the misappropriation but took no steps to inform anyone in authority, and subsequently, on inquiry, endeavoured to hide their knowledge, have been suitably dealt with.

NEW CATALOGUES.

THERE is no man who can so rarely repose on his laurels as the safe-maker. Once upon a time it was sufficient if his work could resist brute strength. Now he has scientific skill and what are sometimes called resources of civilisation against him. The ingenuity of his and the public enemies cannot be denied, and the safe-maker has to meet increased cunning by new inventions. Messrs. Skidmore, of Wolverhampton, have been making safes and doors for more than half a century, and they could tell strange stories about the growth of the power which they have to resist. Another enemy that is no less dangerous is fire. The catalogue of the improved bent steel fire-resisting safes manufactured at the Staffordshire Safe Works shows many varieties. One cheap safe is supplied to post-offices and county courts. There are also register safes, plate safes, bullion safes and gunpowder safes, besides several types of warehouse doors, ventilating safe and strong-room doors. Most of the catalogue sizes, it is said, are kept in stock, and can be delivered in three or four days. The safes are not only secure against fire and thieves, but they are warranted free from damp or other moisture. Papers deposited in them will not become discoloured or defaced.

ROOFING slates may not at first sight appear adapted to become the subject of a catalogue, but the coloured illustrations of various slates produced by the Buttermere Green Slate Company are at least equal to any ordinary inventory in type. There are two great divisions—Coniston and Buttermere—and in each there are "light sea-green," "dark sea-green" and "deep olive-green," each having its peculiar grain or, we might call it, play of light and shade on the surface. There are also "Coniston barred," "Elterwater," "light sea-green," a "reddish rustic" and "copper barred." All these varieties are found in the company's quarries in Westmoreland and Cumberland. A glance at a geological map will show that the district belongs to the Cambrian period (or, according to Sedgwick, Upper Silurian), which was subjected in some ancient epoch to the forces necessary for the production of slate. It is also remarkable for its beauty, which sometimes may be considered as sublimity. Nature has not only supplied a

particularly tough material, but nowhere are the blocs from which slates are derived of such an enjoyable colour. Those who use the slates have therefore the satisfaction of knowing that not only will they be enduring, and serve their purpose as a roof covering, but they will always give pleasure to a cultivated eye. We can see them in London in New Scotland Yard, the Imperial Institute, the Ritz Hotel, the residence in Park Lane of the late Alfred Beit, and in most of the principal towns throughout the country. One of the charms of Mr. Voysey's country houses is derived from their use. No less than about 3,000 tons have been employed in the Claybury asylum at Woodford. The quarries are connected with the London and North-Western system, or with the ports of Barry, Wharfen or Maryport. Besides the slates the quarries yield no less handsome green stone which is adapted for mullions, sills, string-courses, &c., as well as for chimney-pieces, hearthstones and curbs. By its use a connection can be established between the exterior and interior of a building. The catalogue or description gives information about the quarries, which architects are invited to examine for themselves.

EVERY appliance, apparatus or other aid to heating will always be welcomed in England, and now especially, when the waste and nuisance of smoke are avoided. The new electric glow radiators on the Archer system, manufactured by the General Electric Company, Ltd., are particularly adapted for domestic use. As they are movable they can be placed in positions where they will be most required. There are nearly forty varieties, arising mainly from the character of the metalwork serving as radiators. The heater is a product of electricity, and can therefore be supposed to be absolutely free from the defects which arise from the combustion of ordinary fuels. Each radiator has from two to four lamps according to size, and is supplied with the requisite switches, plug socket, &c. Those for small offices or bedrooms are less in size than radiators to heat billiard or drawing-rooms. There is also a very strong variety adapted for warehouses where it is likely to be subjected to rough usage, and others which are suitable for ships and tram-cars. The system is also employed for foot-warmers and kettles. Neither heat nor electric power can be represented

sented in a catalogue, but the brass and copperwork of the radiators appear in forms which must satisfy the most fastidious critic. That such additions to comfort can be obtained at moderate prices is enough to excite wonder, for electric heating is a boon not less remarkable than electric lighting.

PROPORTIONS FOR CONCRETE.*

THE growing use of concrete for structures in which great care must be taken to have only the best material and workmanship, has stimulated investigations into the effect of varying the relative proportions of sand and stone in the mix, the proportion of cement to the total remaining the same, and the result has demonstrated very conclusively that the proper grading and relative proportion of the ingredients have a great influence on the quality of the concrete produced. To demonstrate this great effect, the writer at one time made up a set of beams 6 inches square and 6 feet long, varying these relations very widely from almost all stone to almost all sand, and broke the beams after 30 days with the following results :—

Proportions.	Modulus of Rupture.
1 : 2 : 6	319 lbs. sq. in.
1 : 3 : 5	285 "
1 : 4 : 4	209 "
1 : 5 : 3	151 "
1 : 6 : 2	102 "
1 : 8 : 0	41 "

By inspecting the above table it is seen that although the amount of cement in each of the above beams was the same, namely 1-9 of the total material, some of the beams were over 700 per cent. stronger than others.

In investigating this subject over a term of years it has been found there is one combination of any given sand and stone which with a given percentage of cement makes the strongest concrete, and this is the proportion which also gives the densest concrete; that is, the concrete which contains the least percentage of voids, or otherwise, that which weighs most per cubic foot.

It is found also that this dense concrete is least permeable

* A paper read before the National Association of Cement Users by William B. Fuller.

to water, and consequently is the most durable, and it is also found that as a practical advantage such concrete is most easy to place, working "slick" and filling up all voids and bad corners.

The above-stated law that the densest concrete is also the strongest gives a very easy way of proportioning the materials at hand so as to obtain the best and strongest concrete possible with these given materials. That is, to obtain these proportions by trial, as follows :—

Procure a piece of steel pipe 8 to 12 inches in diameter and about a foot long and close off one end, also obtain an accurate weighing scale. Weigh out any proportions selected at random of cement, sand and stone, and of such quantity as will fill the pipe about three-quarters full, and mix thoroughly with water on an impervious platform, such as a sheet of iron; then, standing the pipe on end, put all the concrete in the pipe, tamping it thoroughly, and when all is in measure and record the depth of the concrete in the pipe. Now throw this concrete away, clean the pipe and tools, and make up another batch with the total weight of cement, sand and stone the same as before, but the proportions of the sand to the stone slightly different. Mix and place as before and measure and record the depth in the pipe, and if the depth in the pipe is less and the concrete still looks nice and works well, this is a better mixture than the first. Continue trying in this way until the proportion has been found which will give the least depth in the pipe. This simply shows that the same amount of material is being compacted into a smaller space and that consequently the concrete is more dense. Of course, exactly similar materials must be used as are to be used on the work, and after having in this way decided on the proportions to be used on the work it is desirable to make such trials several times while the work is in progress, to be sure there is no great change in materials, or, if there is any change, to determine the corresponding change in the proportions.

The above described method of obtaining proportions does not take very much time, is not difficult, and a little trouble taken in this way will often be productive of very important results over the guess method of deciding proportions so universally prevalent. I have repeatedly known concrete to be increased in strength fully 100 per cent. by

simply changing the proportions of sand to stone as indicated by the above method and not changing the amount of cement used in the least.

A person interested in this method of proportioning will find on trial that other sands and stones available in the vicinity will give other depths in the pipe, and it is probable that by looking around and obtaining the best available materials the strength of the concrete obtainable will be very materially increased.

As a guide to obtaining the best concrete, the proportion of cement remaining the same, the following are the results of extensive tests:—

The stone should all be of one size, or should be evenly graded from fine to coarse, as an excessive amount of the fine or middle sizes is very harmful to strength.

All of the fine material smaller in diameter than one-tenth of the diameter of the largest stone should be screened out from the stone.

The diameter of the largest grains of sand should not exceed one-tenth of the diameter of the largest stone.

The coarser the stone used the coarser the sand must be, and the stronger, more dense and watertight the proportioned work becomes.

When small stones only are used the sand must be fine, and a larger proportion of cement must be used to obtain equal strength.

EARTHQUAKE-PROOF BUILDINGS.

A LECTURE was delivered on Thursday in last week by Professor Milne on "Building Construction in Earthquake Countries." In the course of it he said that in 1880 the Japanese established a Seismological Society, and the work was now continued under the auspices of their Government by a committee, who received every year a subsidy of from 1,000l. to 5,000l. They had published sixty or seventy volumes, many of which related to construction in countries liable to earthquakes. Whenever a great earthquake occurred there were to be found on the scene Japanese engineers, architects and seismologists, whose object was to make notes of that which fell and that which stood, and why it fell or stood. The first work of the Seismological Society was to invent instruments, which had now been

adopted the world over. These instruments measured the rate at which earthquake motion was applied to the base of the structures. The result of this had been that engineers had now forces which were expressed in mechanical units, which they had to withstand. If an earthquake shock occurred in London and the suddenness of the back and forward motion was only 1 foot per second, the probability was that there would be 6,000,000 chimney-pots in the streets. At Kingston (Jamaica) the rate at which the motion began and ended was probably about ten times this quantity. Having given the suddenness of the movement the builder could put up structures to withstand it. He made his designs and then tested models of them on a shaking table. These experiments on seismic stability still went on, and buildings, tall chimneys, piers for bridges and other structures had been put into a practical form. The new types of dwelling-houses had been put in districts where earthquakes were very frequent. After twenty-five years of experiment it was found that the new structures stood, whereas those of the old type had been shattered. Necessarily the shock is always felt at the base of the structure first, and the new designs have this in view. They avoid heavy topweights, gables, copings and arches. As the result of twenty-five years of experiment it is found that buildings of the new type stand while those of the old pattern are shattered. As an example, doubtless undesignated, of earthquake-proof construction, the Professor instanced the buildings recently erected at Osborne for our naval cadets. The lecture was illustrated by a number of striking lantern-slides.

At the close of the lecture, on the motion of Mr. Jesse Collings, M.P., who presided, seconded by Mr. Sydney Olivier, it was resolved:—"That this general meeting assembled to hear Professor Milne's lecture on 'The Construction of Buildings in Earthquake Countries' wishes to impress upon the Government the desirability of rebuilding the city of Kingston (Jamaica) on such scientific lines as will render it as far as possible immune from earthquakes, hurricanes and fire; and cordially supports, therefore, the appeal of the Jamaica Relief Committee in Kingston for a substantial grant and an adequate loan on easy terms in order that operation may be conducted on such lines without delay."

CLEE HILL BASALT FOR ROADS.

At a meeting of the roads and bridges committee, the county surveyor of Wilts reported:—Since January 7 I have inspected a large mileage of main roads in all parts of the county with a view of getting a general knowledge of their winter condition. Generally speaking I have found the flint roads and those repaired with Clee Hill basalt are in the most satisfactory state. Limestone surfaces have been extremely muddy and greasy, or, when somewhat drier, in a very sticky condition. The surfaces coated with Shepton Mallet "basalt" appear very liable to "pulling up." I would like to suggest for the consideration of the committee whether, in dealing with the estimates for the year 1907-8, it would not be economical to use a smaller tonnage of really good hard material such as Clee Hill basalt or other stone of a similar class, rather than the larger quantity of very inferior road metals which have very little durability and involve so much cleaning. It must be borne in mind that practically all this material has to be imported into the county. The railway carriage in some cases is considerable, while the hauling, spreading and rolling are almost the same per ton as for the very best materials. Taking into consideration the after expense of cleansing, I feel convinced there is no economy in using these inferior stones, while the disadvantage to all classes of users of the roads is very great, both in heavier traction and discomfort. If it meets with the approval of your committee I propose to obtain quotations at all stations for various well-recognised durable road metals with a view of their use, as far as circumstances permit, on those roads where the traffic or the situation renders their substitution desirable.

The Local Government Board have communicated to the Hammersmith Guardians its sanction of a total expenditure of 220,017*l.* on the erection of the workhouse infirmary, but leaving out the cost of the electric-lighting installation. Towards the expenditure the Board authorised the appropriation of the proceeds of the sale of Consolidated stock amounting to 106,184*l.* and the borrowing of 107,990*l.*, but declines to authorise the balance of 5,843*l.* at present.

HIGH WINCOBANK ESTATE COMPETITION.

THE awards in the competition for site planning in connection with the Model Cottage Exhibition at Sheffield are as follows:—Gold medal, Messrs. W. Alex. Harvey & Arthur McKewan, of Birmingham; silver medal, Messrs. Currey & Thompson, of Derby; bronze medal, Mr. Claude Batley, of Kettering and London. The gold medal design has now been adopted by the Sheffield County Council and the Local Government Board officials have promised to facilitate the work. The following description of the various features of the accepted plan has been furnished:—

It has been considered by the authorities that in successfully developing an estate the following principles should be borne in mind, namely:—(1) Access to estate; (2) aspect of roads—north and south roads most desirable; (3) selection of centre—accessible connections from all points of village; (4) size of gardens. After visiting and carefully studying the site, we are of opinion that it is absolutely essential that the main approach should be at the junction of Bellhouse Road and Windmill Lane; we have therefore planned a main artery running in a south-easterly direction to serve for the future development of the Corporation estate. This opens out the land extremely well. The intersection with the road in continuation of Foxglove Road forms the centre of the village, with its triangle, around which are provided sites for the public buildings as required. This centre is generally accessible from all points, and will form, we think, a natural centre for the whole of the Corporation estate. While straight roads intersecting at awkward angles have been avoided, the main streets have been planned with some degree of straightness for the convenience of access to different parts of the village. Roads running east and west have been practically eliminated, for in so doing much scheming to get the sun on both sides of the cottages will be spared. The idea has been to give breadth to all thoroughfares without being extravagant, and to this end the building line of the cottages has been well set back from the road 20 to 30 feet, the ample front gardens giving a refreshing greenness to the prospect besides a better perspective to the house.

The two quadrangles arranged as shown will also, by

THE "DRAWWELL" GRATE

WAS PLACED

where the "Drawwell" can be seen in action.

varying the frontage line, give an added interest to the roads. The roads are from 40 to 45 feet in width, with footpaths of 8 to 10 feet, planted with trees at intervals of 15 yards. The cottages are arranged in blocks as shown on the drawing, and planned so as to allow free circulation of air around them and to secure the greatest possible

amount of sunshine; the long straggling extensions at the back have been avoided. The average garden space to the cottages varies from 350 to 500 yards approximately, giving twelve houses to the acre; lines of fruit trees are shown, which besides yielding fruit form a pleasant screen between the gardens. In addition to the gardens a number of allot-

LOWER HALSTOW CHURCH.

The following report on St. Margaret's Church, Lower Halstow, has been prepared by Mr. W. D. Caröe:—

This church possesses features of much interest. It is quite evident that a Romanesque structure originally existed upon the site, and this was largely constructed of Roman bricks. The earliest portion of this building seems to exist in the south chancel wall, where a brick window and some brick herringbone work still exist *in situ*. This work belongs either to the early part of the ninth century or else to late in the eleventh. I am not prepared to offer a definite opinion. It is not unlikely that this was a small rectangular cell complete in itself with or without a chancel, existing astward of the present east wall.

The main structure of the present nave appears to be of Early Norman foundation, and it is pretty evident that when this was erected the east wall of the chancel was also brought into being. My surmise is that the ancient cell was made into a chancel with a new east wall and a new nave was attached to it. There are quite clear evidences that the new nave was originally a plain parallelogram lighted with high round-headed windows. One of these is still to be found in the north wall of the tower, and I think evidences of one or more will also be found under the plaster above the arcades of the nave.

There appears to have been some prolongation of the south wall of the nave at its west end, which I am not at present able to decipher.

The next stage in the progress was the insertion of the arcades and the erection of the aisles about 1150-60. This appears to have been rather a clumsy piece of work, as the wall bases, which were cut through for the insertion of the arches, were never properly removed. Early in the thirteenth century great changes were made and the church assumed very much the form in which we now see it. The tower

was erected, the north door inserted, the chancel was arcaded and buttressed, probably also reroofed and re-windowed. One of these windows still exists (but badly restored) in the north wall. A sacristy (now destroyed) was erected in the internal angle between the chancel and the north aisle. To this date also belong the remnants of the Early English font, and many of the ancient encaustic tiles which still exist.

The subsequent changes are not of great moment. In 1340-50 a new west window was added and towards the end of the fourteenth century a new east window and side windows to the chancel, together with a new window at the east end of the south aisle. In the sixteenth century an enlarged window was introduced in the north aisle, to replace a small slit, part of which still remains close at hand.

The pulpit is Jacobean, the western gallery early eighteenth century. The pews belong to about 1750, at which time considerable repairs seem to have been set on foot, among them the enlargement of the south belfry window, and the straightening out of the roof pitches of nave and aisles and sundry repairs in brickwork.

The ancient roofs are probably coeval with the erection of the aisles and exhibit the marked Kentish peculiarity of showing the truss upon the outer wall surface of the gables. This woodwork has been allowed to decay, and has been made good with inserted brickwork, which must not, however, be mistaken. The porch belongs to the nineteenth century. When it was erected, most unfortunately the ancient south-west doorway was swept away, a loss much to be regretted.

One or two special features call for notice. The font, as already said, is a remnant of thirteenth-century work and still retains its four Purbeck subsidiary columns. The present bowl is a mere plaster makeshift.

The marks of the ancient solid screen over the rood-loft are clearly visible, and one of the corbels of the altar beam of the south chapel should also be noted.

The two wall posts which abut against the north tower wall are probably only makeshifts also. The gutter between the tower and the nave roof has no doubt been faulty, and the ends of the beams have become rotten in consequence, and these posts have been introduced to make good the defect.

It is a special interest to the building that it retains a form which was very usual in the thirteenth century—the nave and aisles under one continuous roof. This form was probably almost universal, but few examples remain to us as perfect as this one.

It appears that the ancient timbers of the original roof are fairly perfect, but in order to straighten the pitch a light structure, in parts very flimsy indeed, has been erected over it.

There should be no hesitation in regaining the original form and opening out the trussed rafter roof which will be found when the plaster is removed. The weather roof should be boarded and felted, and the existing tiles, which are in excellent order, refixed. In this work the ugly modern vestry chimney should be removed. Instead of it and the tortoise stoves I suggest an efficient hot-water apparatus. The heating vault can well be placed in the angle between the north aisle and the chancel, and the chimney can be designed in this position to be an ornament rather than the reverse.

A good deal of careful work is required to secure walls which are bulged and fissured, and it is essential to repair windows and doors which have had to be cut about and patched up with cement.

Special attention will be needed to the north-west and north-east angles of the north aisle, both of which need some underpinning. The former angle threatens to fall out altogether. The shaky and bulged condition of the north door must also be dealt with, but this can be done without rebuilding.

The brick angle quoins of the tower are now detached and shaky, having at the outset only been held in by iron cramps, which are now rusting and forcing them out instead of the opposite. It would be a wise measure to secure these, or, if funds are forthcoming, replace them with stone. The general construction of the tower roof is satisfactory, but the hips and the hip knob are letting in the water. The belfry windows are in the last stage of decay, the bell beams and bell frame must be renewed, and the floor of the tower repaired.

The interior of the church and its seating demand most careful attention and consideration. The walls are probably

covered with ancient paintings, whereof an interesting figure of St. Cecilia, attended by an angel, is clearly to be seen under the western arch of the north arcade. Other evidences are also visible, all pointing to the fact that the plastering is original.

The existing gallery at the west end appears to be chiefly constructed of oak, and I suggest the retention of this feature in a somewhat more complete and seemly form. I understand that a mixed choir is usual, and here would be an excellent opportunity of adopting the western choir arrangement which is likely to be more and more favoured in years to come in cases where a surplined choir is not possible.

In considering the pews it must not be forgotten that dry-rot exists in the floors, which are raised very uncomfortably in some parts, and tend to spoil the internal proportions of the building. At the same time some of the seats are very uncomfortable. I should be the first, however, to respect an affection for the old pews, and I have laid out a plan whereby these might be adopted to a more comfortable and reasonable form. In this replanning I should, of course, retain and reuse the old floor tiles and stone flagging. I suggest placing the vestry under the tower with a simple oak screen in front of it, and the font I place near the south door. The pulpit should be put upon an appropriate base, be lowered one step, but should otherwise remain as it is. The porch, of course, has no interest and is in a dilapidated condition. . . . I have designed an appropriate flint and stone porch to take its place, but it is quite clear that this must wait upon all other works which I have called attention to.

I estimate the works as follows:—Roof, walls and windows externally (exclusive of tower), 712*l.*; interior walls, floors, seating and gallery, vestry screen, 357*l.*; heating apparatus, vault and chimney, 220*l.*; tower, walls, windows, louvres, &c., floors and beams, 237*l.*; rehanging bells on new frame, 65*l.*; total, 1,591*l.*

The porch I have designed would cost about 175*l.* in addition to the above. I have estimated as far as I can from past experience what the cost of dealing with the roofs will be, but until these are uncovered it is obviously impossible to discover the exact state of the timbers, and some margin more or less must be allowed.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

* * * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. Gill, town clerk, Town Hall, Birkenhead.

DUDLEY.—March 30.—For a free library in St. James's Road. Competitors must be practising within 50 miles of Dudley. Mr. H. C. Brettell, town clerk, Town Hall, Dudley.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20l. and 10l. will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

FAILSWORTH.—March 28.—The District Council invite designs for a library (cost not to exceed 3,000l.) in Oldham Road. Premiums of 20l. and 10l. Deposit one guinea. Mr. H. C. Broome, clerk, Council Offices, Failsforth.

SUNDERLAND.—March 30.—New church and halls for the Presbyterian Church of England in the Side Cliff Road, Roker, Sunderland. Premiums of 25l. and 15l. respectively. Lithographed plans of site, &c., on application to Mr. George W. Bain, 46 John Street, Sunderland.

WIMBLEDON.—March 9.—For an elementary school in Pelham Road to accommodate 1,000 children. Premiums of 150l. (to merge in the commission) for the first design, and of 100l. and 50l. Mr. J. W. Simpson, assessor. Send in name with qualifications to Mr. A. Steele Sheldon, clerk, Education Office, 12 Queen's Road, Wimbledon.

CONTRACTS OPEN.

BARNET.—March 13.—For the erection of nurses' home at the workhouse at Barnet. Messrs. White, Son & Pill, 13 and 15 High Street, Barnet.

NEW CATALOGUES.

THE new edition of the catalogue of Messrs. S. W. Francis & Co., Ltd., would be sufficient to convince a foreigner that England is a nation of shopkeepers. The illustrations show the perfection and the elaborateness of the arrangements for enabling shopkeepers to display their goods to advantage and to provide for their security. The shop fronts have only a minimum of obstruction in the form of framing, and yet by the skilful adaptation of material adequate strength is provided. The shutters are as important as the ornamental brass sash fronts, for at night the shops are firmly closed against enemies. The shutters,

which are a specialty of the company, are also used for the protection of banks, offices and mansions. Trade has its own laws, and Messrs. S. W. Francis & Co. have studied them carefully, and they have in consequence become recognised factors in the prosperity of traders of all classes.

It was wise for Messrs. Messenger & Co., of Loughborough and London, to illustrate both interiors and exteriors of many of their conservatories, for it is difficult to decide which are the more satisfactory. Whatever architectural arrangement is adopted it is sure to have its use. Many of the structures, we need not say, have been especially designed by architects. The company can say with pride that they have carried out commissions in every part of the kingdom, and the names of those who are fortunate in possessing Messrs. Messenger's greenhouses will be found a sufficient testimony to the superior class of work which has been executed. The list of architects for whom they have worked is also a remarkable testimony. The state that "special attention is paid to carrying out the designs of architects with care and accuracy, and when required we are prepared to send a competent engineer to make surveys and advise generally as to the most suitable arrangement for glasshouses or heating, on condition that out-of-pocket expenses for the journey are paid if no order ensues." Prefixed to the catalogue are some practical hints which will be useful to those intending to erect large or small conservatories, and which also are explanatory of the principles observed in the different classes of the structures. As all materials used in the heating apparatus are also made by the company their effectiveness in working is guaranteed. There is also a patent lever apparatus which is applicable to other buildings besides greenhouses. The examples shown are so interesting they require no supplementary praise.

THE improvement and building committee of the Manchester Corporation have put on record the approval of the agreement come to last week between the authorities of the university and the highways committee on the scheme for extending the university buildings.

CATHEDRAL SERIES.—CARLISLE: SOUTH AISLE, LOOKING EAST.

NEW SESSIONS HOUSE, OLD BAILEY, E.C.—DOVE.

TRADE NOTES.

THE whole of the sanitary fittings required in the new Lumber Motor Works, Coventry, are being supplied by Mr. Wm. E. Farrer, sanitary specialist of Birmingham, London, Cardiff, &c. The order comprises closets, lavatories, urinals, sinks, &c.

THE town clerk of Cape Town has informed Messrs. B. Joyce & Co. that the Corporation are entirely satisfied with the time-keeping qualities of the turret clock installed by the firm, the results showing that a highly creditable standard of time is being maintained by the clock.

THE new hospital for the Smethwick and Oldbury Joint Sanitation Board is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, with ascending smoke flues, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

AN illuminated turret clock has just been erected at the new police courts, Sunderland, with Lord Grimthorpe's improvements inserted, by Messrs. Wm. Potts & Sons, Ltd., of Leeds and Newcastle-upon-Tyne, for the Mayor and Corporation of Sunderland. Messrs. Potts & Sons have also erected a new illuminated clock, with three external dials, for Messrs. Harrod, Barnsley, Yorks, and clock at Hull for the North-Eastern Railway Company.

THE East Indian Railway Company are just having despatched to their order fifty weighing machines for use on their different stations for weighing luggage. These machines have a capacity of 40 cwt. and 56 maunds, and by the use of Avery's patent polygonal bar the weight can be read in either standard, thus preventing any confusion as to charges and also a great saving in time. Each one of

these machines has been tested to its full capacity by their authorised agent before leaving the works of Messrs. W. & T. Avery, Ltd., of Soho Foundry, Birmingham, who are supplying them. Messrs. Avery also have in hand several other large orders for the East.

MESSRS. GEORGE MILLS & Co., engineers, Radcliffe (the proprietors of the "Titan" patent automatic sprinkler), have received letters from firms whose premises were protected by the sprinklers during the past month. One writer says "that had it not been for the prompt action of the sprinklers the mill would have been burned down." In another case it is said that everything in connection with the system, which was set up seven years ago, worked satisfactorily, and the fire was successfully extinguished. The proprietors of a large wood-working factory in London testify to the efficient service rendered by the sprinklers, for when the firemen arrived the fire was quite extinguished.

ELECTRIC NOTES.

MESSRS. AUSTIN & Co., of Newcastle, have introduced an electric lift which does not require an attendant and obviates the danger of insufficiently protected lift openings. Under the system a car will arrive at any floor desired by the simple pressure of a button, and immediately the gate is opened and the passenger steps in the whole of the buttons on the various landings are put out of action, so that only the passenger himself can operate the lift. Inside the car he presses a button corresponding with the floor he wishes to be taken to, and having arrived there the car immediately comes to a standstill. Should he before reaching that floor change his mind as to destination, all he has to do is to press an emergency button, which stops the car, and then, in turn, the button for the floor on which he desires to land. The action of the car, it should be said, locks the gates leading to the lift.

THE electric-lighting committee of the Derby Corporation recommend the Council to fix a uniform charge of 1d. per unit for the supply of electrical energy used throughout the whole day, instead of the present charges of 1½d., 1½d. and 1d.

THE KAHN TRUSSED BAR, ALTERNATING TYPE

TRUSSED CONCRETE STEEL CO.,
CAXTON HOUSE, WESTMINSTER.

THE Aston electricity committee has instructed the borough electrical engineer to prepare a scheme for the electric lighting of the urban district of Erdington. The committee will report to the Town Council that it hopes shortly to submit the scheme for consideration, with a view to application being made to the Local Government Board for sanction to the borrowing of a loan for the execution of the work.

THE Montreal Municipal Council have decided to renew for twenty years, beginning May 1910, the contract of the Montreal Light, Heat and Power Company to supply the city with gas and electricity. The gas contract is a pure monopoly, but in the case of electricity it is provided that any company that cares to come in and compete with the Montreal Light, Heat and Power Company may do so on accepting the same conditions as are imposed on that company. It is claimed, however, that the electricity contract will also prove exclusive in practice.

MR. GRAHAM HARRIS, the arbitrator appointed to decide the dispute between the Leyton Urban Council and the North Metropolitan Tramways Company as to the amount to be paid by the Council for the company's works, which are situated in Leytonstone, has issued his award. The portion of the company's system situated in Leyton and Leytonstone was compulsorily acquired by the Council. The Council contended, however, that they were not required to purchase the works, which did work for the whole system, except so far as they were necessary to the portion which they had acquired. This contention has been upheld by the arbitrator, who awards the company 19,168*l.*, as against the 73,442*l.* demanded. The Council have no use for these car-sheds, having built extensive premises in Lea Bridge Road for the purposes of their electric tramways.

THE contract for the hydraulic-power plant required for the third installation in Cauvery Falls power station, India, which supplies power to the Mysore Gold Fields, has been placed with Messrs. James Gordon & Co., water-power engineers and contractors, Knight-riding Street, E.C., and includes a special design of pelton wheel to develop 2,700 b.h.p. under a fall of 380 feet for direct coupling to alternating current generator, sensitive quick acting governor, and

heavy rivetted steel pipe line 4 feet diameter with expansion joints, relief valve, &c. This is the first order for hydraulic plant for this station obtained by an English firm, all the existing plant being by continental makers. The sub-contract for all the rivetted steel piping required has been placed with the Steel Pipe Co., Ltd., of Kirkcaldy, by Messrs. Gordon & Co.

AFTER consideration of a report from a sub-committee prepared after consultations with Major Cardew, as expert adviser, the electric-light committee of the Coventry Corporation have resolved to make the following important recommendations to the City Council:—(1) That the scheme prepared by the manager for immediate extensions at the electric-light works at the estimated cost of 27,000*l.* be approved, subject to the sanction of the Local Government Board being obtained to the necessary loan. (2) That the scheme prepared by the manager for further extensions of the electric-light undertaking, to cover the needs of the next five years, at a total estimated cost of 180,000*l.*, be approved subject to the sanction of the Local Government Board being obtained to the raising of the necessary capital, and also subject to a special recommendation being presented by the electric-light committee and adopted by the Council before any further expenditure is incurred. (3) That application be made to Parliament during the present session for the raising of capital for the purposes of the electric-light undertaking. (4) That application be also made to Parliament for powers for the Corporation to supply energy in certain districts adjoining the city. (5) That application be also made to Parliament for clauses enabling the Corporation to make charges for stand-by supplies.

COLONEL HELLARD, of the Ordnance Survey Department giving evidence on Tuesday before the Royal Commission on Coast Erosion, stated that during the past twenty of twenty-five years the total gain of land to England and Wales was 30,752 acres, and the loss 419 acres. The general feature was that there had been a gain of land and a loss of foreshore. The popular view that the country was being washed into the sea at the rate of 2,000 acres a year was a mistake.

FIRE-RISKS

MINIMISED BY USING

PATERSON'S

FIREPROOF ELECTRIC CABLES AND WIRES

These Cables are highly fire-resisting and tend to subdue any burning mass without, and any are flame within, the insulation. **Specially suitable when wiring HOSPITALS, INSTITUTIONS, PUBLIC BUILDINGS, THEATRES, PRIVATE HOUSES, &c.** The following testimonial from one of the largest Corporations in the British Isles is **SURELY CONCLUSIVE**:—

"I have tested the samples of Fire-proof Cable which you have forwarded to me, and I find that **their fire-resisting qualities are satisfactory**, I have therefore pleasure in enclosing order for the cable required."

VARIETIES.

NEW Empire theatre is about to be erected in Prince's Street, Devonport. The architect is Mr. Frank Matcham.

A NEW club and institute is to be erected in the Sea View Road, Southend-on-Sea, and building operations will commenced at once.

THE Manchester and Salford Wesleyan Mission are about to erect a new hall with classrooms attached opposite Free Trade Hall, Manchester, at a cost of 50,000/.

ON Wednesday the Cardiff secondary schools committee decided to erect on the site of the present temporary buildings a new boys' intermediate school, at a cost not to exceed 20,000/., inclusive of furniture.

THE plans sub-committee of the Filey Council have approved of plans submitted by Mr. Andie Caine for the erection of an amusement hall and variety theatre, to be built in the Sylvan Glade, near the Crescent.

THE recently-erected church hall for the new church of Saviour, Westcliff-on-Sea, proves to be quite inadequate for the congregation each Sunday. It has been decided therefore to hurry on the erection of the new church at the earliest possible moment.

THE Lincoln City Council were engaged last week in considering the question of the city water supply. Mr. Percy Griffith, the consulting engineer, stated that a depth of 2,015 feet was pierced at the Boultham bore some months ago, and water was found in plenty. Pumping operations have been in progress night and day for several months to purify the water, but without success. The Council decided to continue the boring a further 185 feet. This will bring the bore to the depth of 2,200 feet, which was originally agreed upon.

THE Birmingham Trades Council at their meeting last week carried the following resolution:—"That in the opinion of this Council the refusal of the Local Government to sanction loans to borough councils and others for improvement works, unless the work be done by specially engaged labour, is a retrogressive step, being economically unsound, being against real economy in the cost of production and calculated to seriously depress the standard of life of the workers."

THE New York city authorities have selected in international competition the contract of an English firm for the provision of a refuse-destroyer and boiler, &c., complete, on Staten Island. The destructor will have a capacity of 60 tons per day of 24 hours, and the boiler and its appurtenances are proportioned large enough to efficiently absorb the whole of the heat from the combustion of the refuse.

THERE has been a rush to the hills of Flintshire of late in pursuit of the "simple life," and bungalows of wood frame and iron sheeting on brick foundations are becoming common. The health authorities note that the structures are not in accord with their by-laws. Sanitary officers to whom plans of the bungalows are submitted for approval find no fault with the sanitary arrangements, but while admitting them as suitable erections on the hills they are in doubt as to the advisability of approving them when built on the lowlands. So far the builders have kept to the highlands. A Liverpool firm, it is said, propose to build quite a cluster of bungalows on Flint Common.

IN forwarding his annual report on the health of Millom, Cumberland, to the local authority Dr. Stone, the medical officer, attributed the delay in its preparation to the fact that it was quite impossible to work in the evenings owing to the bad light from the gas. He had not mentioned the bad gas in his report, not wishing to bring down the Local Government Board inspector, but it had been most poisonous all the winter, and no doubt caused illness, though possibly not so much as had been attributed to it. He did not think that Millom people should be blinded and poisoned without some protest.

MR. LOCKHART, C.E., Kirkcaldy, has forwarded a report on a new water scheme for the two Anstruthers and Pittenweem, to take the place of the present reservoirs, the water in which has been condemned as unfit for domestic purposes. Mr. Lockhart proposes the erection of a new reservoir to the north of Carnbee and Kellie Law capable of holding 46,500,000 gallons, and the cost, with three new filters, he estimates at 8,788/. This is exclusive of legal and engineering expenses and the cost of land and wayleave. The scheme is under the consideration of the three town councils, and it is estimated that, if gone on with, there would be a three-months' supply, after giving off 160,000 gallons per day to the inhabitants.

HEAT LOSSES IN BUILDING.*

At the August meeting of the Society, Walter Jones, of Stourbridge, England, read a valuable paper entitled "Heat Losses and Heat Transmission," in which he compared the different coefficients for building losses as given by various authorities. This comparison indicated that the authorities differed greatly as to some coefficients, but were in quite close agreement as to others.

Some years ago I tried to find what actual experiments had been made for determining these various coefficients. The result of this investigation indicated that practically all of our coefficients for heat losses and heat transmissions resulted from experiments made by Peclet in France about 1880, and further that, so far as I could ascertain, these were the only original experiments which completely cover the field. These experiments are described in vol. i. "Traité de la Chaleur," E. Peclet, Paris (1st ed., 1863; 4th ed., 1878). I have published in the fourth edition of my work on "Heating and Ventilating" a translation of that portion of Peclet which relates to heat transmission through radiators and buildings. There is not available a translation of Peclet in English. Various authorities in different languages, in applying Peclet's experimental values to different conditions, have obtained slightly different results, partly due to difference in assumed conditions and partly due to the translation, and this in a large measure accounts for the difference in the various coefficients as given by different authorities.

There is no doubt that in some cases coefficients had been deduced from rules of practice or rules of thumb, but such coefficients have not generally been of a scientific form nor have they been widely used.

In the English work on "Heat," by Box, numerous examples of the application of Peclet's coefficients were given. This work was published very early, it was the first English work to call attention to Peclet's experiments, and is in a measure largely responsible for the coefficients which are used extensively by the English-speaking people.

Box and Peclet both present methods of computing

building losses by applying the coefficients to small sections of the building. This method is an accurate one, but seems to me, in view of the crudeness of the coefficients themselves, a refinement which is not warranted except for very large buildings. For that reason I advise the use of average values in computing the heat losses from walls and windows of buildings of ordinary or small size. My opinion is that the average values, which can be readily and quickly applied, give fully as satisfactory results as the application of each special coefficient to each special part of the building, and it saves a great amount of labour. For large buildings the more exact method is preferable, suggested by Box and Peclet.

From my study of the Peclet experiments, which I believe are the scientific basis of the coefficients practically used by all our authorities, I do not believe that they have such a degree of accuracy as to warrant extending our computation results very far. To illustrate, if the Peclet experiments involve an error of 10 per cent, which I think probable, and if these determine our coefficients, it is rather absurd and foolish to carry our calculations in applying these coefficients to $\frac{1}{2}$ of 1 per cent; yet this is a thing which all of us are very prone to do, and we often imagine that because our figures are carried to small decimal places our results are therefore very accurate.

The coefficients which are given by Recknagel and Rietschel agree so closely with those derived from Peclet's experiments, that I believe they have the same origin as those which we have obtained from Box, which we know came from Peclet. This fact confirms me in the opinion that the scientific derivation of the principal coefficients used for heat losses from buildings is derived from Peclet's experiments.

Respecting the coefficients for heat transmission from radiating surfaces, a large number of experiments have been made in nearly every country. The coefficients derived from these experiments, however, agree so closely with those given by Peclet that for general cases those given by Peclet can be used with satisfactory results.

In view of the recent improvements in apparatus for measuring heat transfers and of the changes in building construction which have occurred during the last quarter of the century, it would certainly be desirable if the experimen

COOKING, LAUNDRY, HEATING, VENTILATION,

made by Peclet could be repeated on a larger scale and with more accurate instruments. It is not probable, however, that if this were done the results would be essentially different from those obtained years ago by Peclet. We know that within certain practical limits Peclet's results are accurate, since the coefficients obtained from them when applied to modern heating systems give satisfactory results. In two cases I have had an opportunity of comparing the heat transmitted through the walls and windows of a building with the average of Peclet's results, and in both these cases the comparison checked up very closely.

In the first case a room on the second floor with exposed side and end had 246 square feet of wall surface and 96 square feet of window surface. By experiment I found that when the air in the room was 28 degs. above that outside, 4,247 B. t. u. per hour were required to maintain a uniform temperature and represented the building losses; when 27 degs. above, 4,240 B. t. u. were required. The average of Peclet's results indicates that 4 square feet of wall surface or 1 square foot of window surface transmits practically one B. t. u. per square foot per hour per degree difference of temperature. Applying this rule to the cases stated, the building loss for the first case should have been 4,410 and for the second case 4,253 B. t. u.

In the second case a test of the New York State Veterinary College showed that to maintain the building 31 degs. warmer than the outside air, 16,000 B. t. u. were required per minute, of which 39 per cent. escaped in the ventilation flues and 61 per cent. passed by conduction through the walls and windows. The building was exposed on all sides, was three storeys in height, had 9,280 square feet of glass and 31,644 square feet of exposed wall surface. By the rule founded on Peclet's average results as above, the building loss should be 532,952 B. t. u. per hour. The actual loss by experiment by the building was 547,200 B. t. u. per hour, which is within 2 per cent. of that called for by the rule. In this case the building was of brick, thickness of the walls 24 to 16 inches, the windows having single glass.

The above experiments, as well as those which are made by structures proportioned in accordance with the coefficients, indicate the substantial practical accuracy of the early experiments by Peclet, and show that we do not

run any very great risk of making serious mistakes in applying them. It is quite probable that the variation in conditions as to materials or exposure, which are not considered in the average case, cause most of the errors in the application of these coefficients.

THE GENERAL POST OFFICE EXTENSION.

WE learn that the tender of Messrs. Holloway Bros. has been accepted for the erection of the two new buildings which will form a further addition to the existing establishment at St. Martin's-le-Grand. The whole of the site formerly occupied by Christ's Hospital is to be excavated to the average depth of 26 feet so as to accommodate two underground storeys in addition to a large boiler-house, and above ground level there will be two buildings, one 201 feet long by 60 feet wide by 85 feet high for the use of the public, and the other 312 feet long by 185 feet wide by 63 feet high for use as a sorting-office. These three structures are to be built throughout on the Hennebique ferro-concrete system. The buildings were designed by Sir Henry Tanner, principal architect to H.M. Office of Works. We are informed that Mr. Mouchel, the introducer of the Hennebique system, has been appointed as consulting engineer.

THE sub-committee of the Salford Corporation charged with the consideration of the question of building a new town hall have approved a scheme which provides for the erection of a structure at a cost of 80,000*l.*, and the expenditure of a further sum of 20,000*l.* on furniture, fittings and other necessary equipments. This estimate of 100,000*l.* does not take into account the cost of the site, which was not decided on, although the neighbourhood of Peel Park was spoken of. The new building, if the recommendations are adopted, will be on the lines of and harmonise with the Technical Institute in Peel Park. It will provide accommodation for all the offices in the present town hall with the exception of the police offices and the police courts, which it is proposed shall remain in their present situation.

WARING'S

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

NEAR OXFORD CIRCUS, LONDON.

ALSO AT LIVERPOOL, MANCHESTER, AND PARIS.

WHERE SILENCE IS DESIRABLE.

THERE are many water-closets in the market which appear as if they were intended to imitate the Cataract of Lodore in a small way, for the water comes sounding and bounding and rounding, and grumbling and rumbling and tumbling, and clattering and battering as described by Southey for children. If there was an advantage to compensate for so much fuss which disturbs quiet houses and shocks modesty there would be some excuse for it; but it is all mere "sound and fury signifying nothing"—to use Macbeth's words. It is needless to enter into an explanation of the causes of a commotion which is a satire on sanitation. Many people believe it to be a sign of efficiency, but that it is a preventable evil is demonstrated by the Grundy closet, "The Only," which belongs to the Sanitary Appliances Syndicate. It has been found that under adverse conditions, such as when placed on a wooden floor in a timber building, neither filling of closet nor discharge is audible at a distance of a couple of yards. Waste of water is also prevented, although there is no lack of hydraulic force. The cost, no doubt, is above that of the ordinary closet, but one having silent automatic action and non-ball valve can be supplied for 65s. The value of the improvement can best be estimated by seeing one of "The Only" closets at the show-rooms of the syndicate, 68 Victoria Street, Westminster. Owing to the success of the syndicate it is understood that a company on a larger scale will be organised, as from the variety and importance of the appliances it should be an opportunity for profitable investment.

BUILDERS' EXCHANGE, BIRMINGHAM.

At the inauguration of the Builders' Exchange Club on the 28th ult. there were a series of demonstrations given, and at 6.30 a lecture upon "Ford Stone," by Mr. L. P. Ford, the inventor.

The president for the year is Mr. Ebenezer Parkes, M.P. for the Central Division of Birmingham, and the vice-presidents are Major J. Howard Cartland, J.P., Alderman J. J. Gittings, J.P., Councillor H. M. Grant, Messrs. A. Handley, Wm. Sapcote, Ralph Webb, J. B. Whitehouse,

F. G. Whittall, with a general committee upon which are other builders, and many of the principal firms are represented.

Vice-president Mr. W. Sapcote presided at the opening ceremony, and described the utility of the institution for architects, builders and others, and referred to the progress made under the able management of Mr. W. J. Spurrier, the founder and secretary.

The next item of the programme was a demonstration of concrete-block making by Messrs. Dunmore & Co., of Irthlingborough, Northamptonshire. During the making of six blocks a large number of architects, builders, &c., keenly followed each detail of the simple process of manufacture under the active superintendence of Messrs. W. A. T. Flitton, manager, and Thos. Lenton, secretary.

Mr. Spurrier then explained and demonstrated the valuable effect of the action of the special powers of the Chappuis daylight reflectors. These reflectors are arranged in the lower exhibition hall so that they are brought into position by a pulley and cord, and then raised to reflect the light some 40 feet. Next he illustrated the action of the Van Kannel panic revolving door, which opens immediately pressure is made against the closed door.

A very interesting demonstration was the varied uses to which the new metal ladder tape can be put. This is a Birmingham invention and production, and was used in the building of the new telephone boxes at the Builders' Exchange. Ten thousand feet of this metal ladder tape only occupies a cubic foot, and is opened out into the ladder by being pulled through a simple tool. This ladder tape is then stretched and laced on to a framing or uprights and plastered.

In the evening Mr. Ford delivered his lecture upon "Ford Stone." He gave the history of its inception and production, and a large number of lantern slides were shown of Birmingham buildings demonstrating the action of the local atmosphere on the natural stones, and he claimed that Ford stone would resist the action of the acid fumes and so prevent the disfiguring of the buildings and effect a great saving in cost.

Mr. G. H. Jack, C.E., F.G.S., was in the chair for this part of a particularly interesting evening.

THE HOUSING QUESTION AT COVENTRY.

THE Coventry City Council have decided upon three important recommendations by the committee appointed to consider the problem of the housing of the working classes. The first is that twenty-two tenements, on the dual tenement system, should be erected by the Corporation on the west side of Short Street, according to plans prepared by the city engineer, at an estimated cost (including that of site) of 3,930*l.*, and that application be made to the Local Government Board for their sanction to a loan of that amount. Secondly, it is proposed that the city engineer's scheme for laying out 8 acres of land owned by the Corporation at the north end of Harrow Lane, and the erection thereon of 216 self-contained houses at a total estimated cost of 49,480*l.*, be provisionally approved, subject to any arrangement to be hereafter made by the Council as to the appropriation of a portion of the land for the purpose of a public elementary school, and also subject to special recommendations being presented from the committee before any expenditure beyond that subsequently dealt with is incurred. The third recommendation is that the erection of forty-eight houses, self-contained and fronting to Narrow Lane—being part of the scheme previously mentioned—be proceeded with at an estimated cost of 10,832*l.*, and that the Local Government Board be asked to sanction a loan of that amount.

FIREMASTER M'COLL reports that the causes of the eighty-seven fires which occurred in Glasgow during the four weeks ending February 12 were:—Defective building construction, 38; dropped lights, 11; sparks from fire, 5; hot ashes, 3; goods in contact with gas jet, 2; defective electric-light installation, heat from gas stoves, vapour in contact with lights, children playing with lights and escape of gas, 2 each; friction of machinery, spark from furnace, fat boiling over, wax boiling over, incendiarism, paraffin lamp and electricity, 1 each; and unknown, 11. Thirty-seven of the fires due to defective building construction occurred in properties erected before, and one in a property erected since, the passing of the Building Regulations Act, 1892. There were three malicious alarms.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, March 4, Mr. J. W. Wilson, vice-president, in the chair, a paper was read on "The Connaught Bridge, Natal," by Mr. Edward J. Stead, assistant district engineer, Public Works Department, Natal, and of which the following is an abstract:—

The author opened his paper with some notes on the Umgeni river and the watershed, giving particulars of rain-fall and floods. He then gave a general description of the bridge. The total span between abutments is 922 feet 8 inches, and the number of spans is twelve. The width of the bridge between curb plates is 22 feet. The south abutment was described in detail. There are 75 piles in the foundation, of an average length of 29 feet each, which are braced together at the heads and surrounded by a mass of concrete. The arrangements for driving piles were described, and the loads on piles given, together with details of the concrete abutment and wing walls faced with masonry. The north abutment consists of a pair of cylinders similar to the piers, as owing to the nature of the foundation it was not practicable to construct a concrete abutment. The embankment is carried round the cylinders and faced with masonry pitching.

The author then described the cylinder piers and the methods adopted to sink them. The cylinders were of steel, 6 feet diameter below and 4 feet diameter above river bed. The author dealt with the difficulties experienced in connecting the cylinders of different diameters by means of a taper cylinder as provided in the design of the bridge, it being found difficult and expensive to sink cylinders exactly to meet the fixed level of taper pieces. He then described a telescopic form of joint which was ultimately adopted in all piers except the first. The cylinders were sunk to an average depth of 77 feet below river bed, the deepest cylinder being 103 feet 8 inches. The guides and staging, plant and method of sinking were dealt with, and the strata sunk through were described.

The author next gave particulars of observations taken of the resistance by surface friction on the cylinders, show-

Architects.

ing how the different strata affected the amount of loading necessary to overcome the resistance, and he added some of his opinions deduced from the observations on the works. The cylinders were filled up solid with concrete and the method of placing the concrete was described, after which the author gave details of the upper piers and bracings. During the construction of the bridge some of the cylinders were tested for their supporting power, and a description was given of two of these tests, which in each case were applied after the concrete hearing had been deposited.

The superstructure is of steel throughout; the spans are 77 feet 4 inches from centre to centre of piers; the width between the main longitudinal girders is 24 feet, and footways are carried on brackets on the outside of each main girder. Each span has eleven cross-girders, upon which are carried the corrugated decking plates. The roadway is macadamised.

Mr. Stead gave an account of the damage done by an extraordinary flood when the river rose 14 feet in twelve hours. The old low-level timber bridge was swept away and it was necessary to construct a temporary bridge, 500 feet long and 19 feet wide in seventeen spans, the bridge having been built in ten days.

Finally the author stated that the cost of the bridge was 52,000*l.* The steelwork was made by Messrs. Westwood & Co., of London, from the design of Mr. H. G. Humby, consulting engineer to the Natal Government. The contractors were Messrs. Smullins Bros. & Mansel, of Johannesburg. The time occupied in the erection of the bridge was twenty-two months, viz. from March 1904 to January 1906.

REINFORCED CONCRETE CONSTRUCTION.

THE following are the by-laws adopted for reinforced concrete construction in Toronto :—

Before permission to erect any reinforced concrete structure is issued, complete drawings and specifications must be filed with the inspector of buildings, showing all the details and the size and position of the reinforcing rods, stirrups, &c., and giving the composition of the concrete;

provided, however, that permission to erect any reinforced concrete structure does not in any manner imply the acceptance of the construction until after tests have been made of the actual construction to the satisfaction of the inspector of buildings.

The execution of concretework shall be confided to workmen who shall be under the control of a competent foreman or superintendent.

Proportion of Concrete.—The concrete shall be mixed in the proportions of not less than one part of cement, two parts of sand and four parts of clean stone or gravel, or in such other proportions as may be necessary to make the resistance of the mixture to crushing not less than 2,000 lbs per square inch after hardening for twenty-eight days.

Method of Testing.—The tests to determine this value must be made by a competent engineer, furnished by the owner of the building or by the contractor, and such tests as well as the preparing of the mixture for the same, shall be made in the presence of and under the direction of the inspector of buildings or his regularly authorised assistants. All concretework entering into the construction of any building shall be made of like material and proportioned in the same manner as the concrete in the accepted tests.

Mixing of Concrete.—The concrete used in reinforced construction must be what is usually known as a "wet" mixture, and all concrete shall be thoroughly mixed by machine to an even, uniform consistency. When a section or panel of reinforced concrete or any trussed concrete member is started, it must be finished in its entirety before shutting down for any purpose which will make a necessary delay of more than thirty minutes' duration, and any batch or remnant of concrete which has been allowed to stand until it begins to set must be at once removed, and shall not be mixed and used in any portion of the work.

Putting Concrete in Place, &c.—All concrete must be placed in the forms in its final position as quickly as possible after being properly mixed, and particular attention must be given to the thorough puddling of concrete around a reinforcement, and under the lower flanges of all beams so as to make the entire mass a monolithic body entirely free from voids or unfilled portions.

Quantity of Cement.—Only high-grade Portland cement shall be used in reinforced concrete construction. Such

now charged at 6d. each.

GILBERT WOOD & CO.,
Publishers, "The Architect,"
6-11 Imperial Buildings,
Ludgate Circus, London,

cement when tested neat shall after one day in air develop a tensile strength of at least 200 lbs. per square inch, and after one day in air and six days in water shall develop a tensile strength of at least 500 lbs. per square inch, and after one day in air and twenty-seven days in water shall develop a tensile strength of at least 600 lbs. per square inch. Provided always that a copy of a duly certified statement of the result of each such test of the cement to be used in any concrete construction shall be filed with the city architect before the said cement is used in said construction. Other tests as to fineness, constancy of volume, &c., made in accordance with the method prescribed in recognised "standard specifications for cement," shall be furnished when deemed necessary by the city architect.

Sand.—The sand to be used must be clean, sharp and coarse, perfectly free from loam or dirt.

Crushed Stone or Gravel.—The stone used in the concrete shall be clean crushed stone or gravel of a size that will pass through a $\frac{3}{4}$ -inch ring. The stone shall be fresh broken and screened, free from dust, and if gravel is used it shall be thoroughly washed.

Method of Reinforcing.—All reinforcing steel shall be completely enclosed by the concrete; the thickness of concrete on the bottom or exposed side of any reinforcing steel member of a lintel, beam, girder or column shall not be less than 2 inches, and there shall not be a less thickness than 1 inch on the bottom of the steel in a floor slab.

Thickness of Concrete between Reinforcement Rods.—The steel in lintels, beams or girders shall be disposed so that there shall not be less than one and a half times the thickness of the steel, in concrete, between the different pieces of steel of which the reinforcement is composed.

Stresses.—Reinforced concrete shall be so designed that the stresses in the concrete and the steel shall not exceed the following limits:—

Extreme fire stress on concrete in compression	500 lbs. per square inch
Concrete in direct compression	350 lbs. per square inch
Shearing stress in concrete	50 lbs. per square inch
Tensile stress in steel	16,000 lbs. per square inch
Compression in steel	12,000 lbs. per square inch
Shearing stress in steel	10,000 lbs. per square inch

Adhesion of Concrete to Steel.—The adhesion of concrete to steel shall be assumed to be not greater than the shearing strength of the concrete.

Moduli of Elasticity.—The ratio of the moduli of elasticity of concrete and steel shall be taken as 1 to 12.

Bending Moments.—The following assumption shall guide in the determination of the bending moments due to the external forces:—Lintels, beams and girders shall be considered as simply supported at the ends, no allowance being made for continuous construction over supports, and the bending moment for a uniformly distributed load on such a member shall be taken at not less than $\frac{WL}{8}$, where W is the uniformly distributed load in pounds and L is the span in inches.

Floor plates, when constructed continuous, and when provided with reinforcement at top of plate over the supports, may be treated as continuous beams, and the bending moment for a uniformly distributed load taken at not less than $\frac{WL}{10}$. But in the case of square floor plates which are

reinforced in both directions and supported on all sides, the bending moment may be taken at $\frac{WL}{20}$.

The floor plate to the extent of not more than five times the width of any beam or girder may be taken as part of that beam or girder in computing its moment of resistance.

Moment of Resistance.—The moment of resistance of any reinforced concrete construction under transverse loads shall be determined by formulas based on the following assumptions:—

(a) The bond between the concrete and steel is sufficient to make the two materials act together as a homogeneous solid. (b) The strain in any fibre is directly proportionate to the distance of that fibre from the neutral axis. (c) The modulus of elasticity of the concrete remains constant within the limits of the working stresses fixed in this by-law. (d) The tensile strength of the concrete shall not be considered.

Shearing Stress and Adhesion.—When the shearing stresses developed in any part of a reinforced concrete

PATENT DIRECT-ACTING VERTICAL STEAM PUMPS

ENGINEERS,

Park Works, MANCHESTER. Salford Ironworks, MANCHESTER.
Queen Anne's Chambers, Westminster, LONDON.

construction exceed the safe working strength of concrete as fixed in this by-law, a sufficient amount of steel shall be introduced in such a position that the deficiency in the resistance to shear is overcome. When the safe limit of adhesion between the concrete and steel is exceeded, provision must be made for transmitting the strength of the steel to the concrete to at least such an extent as will bring the adhesion to within the safe limit fixed in this by-law.

Reinforced Concrete Columns.—Reinforced concrete may be used for columns when the ratio of length to least side of diameter does not exceed twelve. The reinforcing rods shall be rigidly tied or latticed together at intervals of not more than the least side or diameter of the column. In all cases where reinforced concrete columns rest upon girders, walls or foundations or other piers either wrought or cast-iron or steel bearing plates or bases must be provided. The plates or bases to be of sufficient size to distribute the load which the column supports to such an extent that the compressive stress per square inch on the girder, wall or foundation or other pier will not be in excess of that allowed in this by-law for masonry, brickwork or the different kinds of concrete, or if the girder, wall or foundation or other pier is constructed of material the strength of which is not specially referred to in this by-law, the plates or bases must be of a sufficient size to distribute the load to such an extent that the safe compressive stress per square inch allowed by standard engineering authorities on such material will not be exceeded. The plates or bases must also be either of sufficient thickness or be braced or webbed so as to resist within the limit of stress allowed in this by-law the bending and shearing stresses to which they will be subjected by the columns, and the ends of all reinforcing rods must be milled or sawed off normal to the perpendicular axis, and each must have a full and perfect bearing on the plate or base.

Tests.—*To be Made by Contractor on Demand.*—The contractor shall be prepared to make, and shall make, load tests on any portion of a reinforced concrete construction within a reasonable time after erection, as often as may be required by the inspector of buildings. Such tests shall show that the construction will sustain a load of three times that for which it is designed without any sign of failure. No concretework shall be done in freezing weather except

where the influence of frost can be and is entirely excluded.

Hollow Concrete or Cement Blocks.—The exterior walls of buildings not exceeding 35 feet in height to the highest point of the roof, from the finished ground line adjoining the walls or surface of sidewalk, if built on the street-line may be constructed from the ground floor joist up with hollow concrete or cement blocks, provided the blocks meet the requirements hereinafter specified, and that the walls are made of the same thickness as hereinbefore called for in the tables for brick walls.

The blocks upon which joists rest are to be solid, and if special blocks are not used and blocks have to be cut to allow joists to enter the walls, the spaces in the blocks between the joists to be filled in solid with concrete of a similar description to that of which the blocks are made and all portions of the wall, also piers or buttresses which support beams or girders causing concentrated loads shall be solid blocks and of sufficient strength to sustain within the limit hereinafter specified the full load for which support is intended.

The hollow space in a block shall not exceed one-third ($\frac{1}{3}$) of the superficial area, and no block shall be used which will at the age of twenty-eight (28) days crush at less than one thousand (1,000) lbs. per square inch of solid area, and no block in a wall, pier or buttress shall be subjected to a greater stress than one hundred and fifty (150) lbs. to the square inch of available effective section.

No concrete or cement blocks shall be used in the construction of any building until they shall have attained the age of at least three (3) weeks, and all blocks shall be made from Portland cement of a similar quality in all respects to that hereinbefore specified for under the title of "reinforced concrete construction."

The manufacturer or user of any such blocks shall before commencing the erection of a structure with them submit a sample to the inspector of buildings for approval, and at their own expense and under the supervision of the said inspector or his representative have, at any and all times, such tests made as may be required.

No concrete or cement blocks shall be used in the construction of any structure until they shall have been approved of and accepted by the inspector of buildings.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. Gill, town clerk, Town Hall, Birkenhead.

DUDLEY.—March 30.—For a free library in St. James's Road. Competitors must be practising within 50 miles of Dudley. Mr. H. C. Brettell, town clerk, Town Hall, Dudley.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20l. and 10l. will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

FAILSWORTH.—March 28.—The District Council invite designs for a library (cost not to exceed 3,000l.) in Oldham Road. Premiums of 20l. and 10l. Deposit one guinea. Mr. H. C. Broome, clerk, Council Offices, Failsforth.

SUNDERLAND.—March 30.—New church and halls for the Presbyterian Church of England in the Side Cliff Road, Roker, Sunderland. Premiums of 25l. and 15l. respectively. Lithographed plans of site, &c., on application to Mr. George W. Bain, 46 John Street, Sunderland.

CONTRACTS OPEN.

ALDERMAN'S GREEN.—March 22.—For proposed alterations and additions to premises at Alderman's Green, near Coventry. Mr. T. F. Tickner, architect, High Street Chambers, Coventry.

AMBLESIDE.—March 28.—For the whole of the various trades and works in connection with grammar school. Messrs. Walker, Carter & Walker, architects and surveyors, Windermere.

BLACKBURN.—March 18.—For the erection of offices, van shed, &c., in Blakey Street. Messrs. Simpson & Duckworth, architects, Richmond Chambers, Blackburn.

BORDON.—March 20.—For the erection of barrack expense stores at Bordon, Hants, in the Aldershot district, Woolmer sub-district. Mr. Harry B. Measures, director of barrack construction, War Office, Atterbury Street, Grosvenor Road, S.W.

BOURNBROOK.—March 20.—For a tower 300 feet high at the new university buildings at Bournbrook, Birmingham. Deposit 2*l.* 2*s.* Sir Aston Webb, R.A., and Mr. E. Ingress Bell, architects, 19 Queen Anne's Gate, London, S.W.

CARDIFF.—March 28.—For the erection and completion of a manual instruction centre at Splott Road Council school, Roath. Mr. W. Harpur, M.I.C.E., city engineer, City Hall, Cardiff.

CHELTEMHAM.—March 16.—For building shop and dwelling-houses at Bishop Street and Henrietta Street. Mr. Daniel Conroy, architect, 21 Shipquay Street, Londonderry.

CHESTER.—March 20.—For public elementary school for 350 boys, to be erected in George Street, Chester. Deposit 1*l.* Mr. H. Beswick, architect, Newgate Street, Chester.

COCKERMOUTH.—March 18.—For erection of a lean-to building at the rear of Corporation offices in Stanley Street. Mr. George Keyte, Town Hall, Workington.

DONCASTER.—April 3.—For the erection of a wing at the Yorkshire Institute for the Deaf, Doncaster. Deposit 1*l.* 1*s.* Mr. E. Hall Ballan, architect, 19 and 20 Baxter Gate, Doncaster.

DORCHESTER.—April 3.—For building three cells at the town police station. The County Accountant's Office, Dorchester.

DURHAM.—March 19.—For alterations to schools at Cox Green, Woodland, and High Spen. County Education Committee's Architect, Shire Hall, Durham.

DURHAM.—March 21.—For a house proposed to be built at the top of Western Hill. Names to 5 Silver Street, Durham.

ERDINGTON.—March 26.—For the erection of a west wing to the No. 2 north pavilion at the workhouse, Erdington, near Birmingham. Send names and addresses to Mr. John

North, clerk, Union Offices, Vauxhall Road, Birmingham, by noon on March 18. Deposit 5*l.* Messrs. C. Whitwell Son, architects, 3 Newhall Street, Birmingham.

FALKIRK.—March 19.—For the mason, joiner, slate plumber, plasterer, heating, glazier, tiler and painter's work of new infant department at Comely Park school. Messrs. A. & W. Black, architects, Falkirk.

GLOUCESTER.—March 20.—For the erection of proposed schools in Denmark Road. Deposit 3*l.* Send names to Mr. Walter B. Wood, architect, 12 Queen Street, Gloucester, by March 20.

HANDSWORTH.—March 19.—For building and other work at the tramway depôt, Birchfield Road:—(A) for raising and reconstructing iron roof of the car-shed, rebuilding walls, erecting steel stanchions and other work; (B) for drainage, alterations to inspection pits and other work. Mr. H. Richardson, A.M.I.C.E., surveyor, Council House, Handsworth, Birmingham.

HEMEL HEMPSTEAD.—March 27.—For the building work in connection with the construction of an elevated water tower at Felden, near Boxmoor. Deposit 5*l.* 5*s.* Mr. Lovell Smeathman, town clerk, Hemel Hempstead.

HERTFORD.—March 18.—For the erection of form-room and dormitory annexes at Haileybury College. Send name to Messrs. John W. Simpson & Maxwell Ayrton, architects, 3 Verulam Buildings, Gray's Inn, London, W.C.

IRELAND.—March 25.—For building a parish church and presbytery at Belgooly, Cork. Mr. M. A. Hennessy, architect, 74 South Mall, Cork.

IRELAND.—March 27.—For building villa at Victoria Park, Londonderry. Messrs. R. E. Buchanan & Co. architects, Castle Street, Londonderry.

KEIGHLEY.—March 27.—For the erection of a fence wall at Cophurst. Mr. Walter Fowlds, borough engineer, Keighley.

LEEK.—March 21.—For extensions and additions to the isolation hospital, Ashbourne Road. Deposit 2*l.* 2*s.* Mr. W. E. Beacham, surveyor, Town Hall, Leek, Staffs.

LEE.—March 22.—For the erection of conveniences and a dressing-room at Northbrook Park, Bromley Road, Lee, Kent. Mr. G. L. Gomme, clerk, County Hall, Springfield Gardens, S.W.

LEYLAND.—March 23.—For reconstructing a road-bridge over Mill Brook, in Slater Lane. Mr. Wilkinson, surveyor to the Council, Public Hall Buildings, Leyland, Lancs.

LONDON.—March 26.—For repairs and alterations to 164 Denmark Hill, Ruskin Park. Mr. G. L. Gomme, clerk, County Hall, Spring Gardens, S.W.

MANCHESTER.—March 20.—For the erection of the City Road municipal school, Hulme, Manchester. Deposit 2½ 2s. The Education Offices, Deansgate, Manchester.

MANNINGHAM.—March 16.—For the re-erection of a box-works at Cornwall Terrace, Manningham, Bradford. Mr. Benjamin Dobson, architect, 5 Charles Street, Bradford.

MARAZION.—April 5.—For the erection of a police constable's dwelling-house at Marazion, Cornwall. Mr. Oliver Caldwell, architect, County Offices, Bodmin.

MATLOCK BATH.—For a pavilion to be erected on the promenade, Matlock Bath. The materials of external walls to be of stone, brick, iron, glass, concrete or other approved, or a combination thereof. Deposit 1½ 1s. Cost not to exceed 2,000l. Mr. Wm. Jaffrey, surveyor, Council Chambers, Matlock Bath.

MITFORD BRIDGE.—March 23.—For widening the Mitford bridge, Northumberland. Mr. J. A. Bean, county surveyor, the Moothall, Newcastle-on-Tyne.

NEWARK.—March 18.—For rebuilding a bridge on the Swinderby Road, North Collingham. Mr. R. Oakden, jun., surveyor, 17 Winchelsea Avenue, Newark.

NEWCASTLE-ON-TYNE.—April 13.—For construction of a coal shed at the city asylum, Coblodge. Deposit 2½ 2s. The City Engineer's Office, Town Hall, Newcastle-upon-Tyne.

NEWCASTLE-UPON-TYNE.—March 16.—For the construction of an underground public convenience at the corner of Church Street and Station Road. The Sanitary Committee, Committee Clerk's Office, Town Hall, Newcastle-upon-Tyne.

OVENDEN.—March 28.—For the various trades in erection of a Sunday school at Ovenden. Messrs. Chas. F. L. Horsfall & Son, architects.

PENDLETON.—April 8.—For erecting a school to accommodate about 1,120 children at Halton Bank, Pendleton,

Salford. Deposit 1½ 1s. Mr. John H. Woodhouse, architect, 100 King Street, Manchester.

RADSTOCK.—March 16.—For additions and improvements to the Radstock Council school, Somerset. Mr. W. F. Bird, Midsomer Norton.

ST. AUSTELL.—March 18.—For inserting new shop front, enlarging shop, &c., to premises, Fore Street. Mr. B. C. Andrew, architect, Biddicks Court, St. Austell, Cornwall.

SAXMUNDHAM.—March 21.—The East Suffolk county education committee invite separate tenders for erection of the following:—(1) A new infants' Council school at Dell Road, Oulton Broad; (2) a special subjects centre on part of the Council school playground at Saxmundham. Mr. T. E. Key, architect, Aldeburgh.

SCOTLAND.—March 18.—For mason, carpenter, slater, plasterer, plumber, painter and glazier, and iron beamwork of additions to Buckie public schools. Mr. John Macdonald, clerk to the Ruthven School Board, Buckie.

SHERBURN HILL.—March 19.—For erection of the Sherburn Hill school for about 250 scholars. The County Education Committee's Architect, Shire Hall, Durham.

SHILDON.—March 19.—For the erection of a school at Shildon for about 1,100 scholars:—(1) Below ground-floor levels; (2) above ground levels (including latrines, play-sheds, playgrounds, boundary-walls, &c.). The County Education Committee's Architect, Shire Hall, Durham.

SKIPTON.—March 20.—For the mason, joiner, plumber, painter and slater's work required in erection of five cottages in Otley Road. Mr. John Parkinson, 22 Belle Vue Terrace, Skipton.

STAINLAND.—March 16.—For the mason, carpenter, joiner, plumber, glazier, plasterer, slater and painter's trades in erection of six houses at Stainland, Yorks. Mr. H. Thompson, architect, Southgate Chambers, Elland.

WALES.—March 16.—For the erection of fifty houses at Twynrodyn, Merthyr, and for the construction of two streets in connection therewith, including drainage works. Deposit 1½ 1s. The Borough Surveyor, Town Hall, Merthyr Tydfil.

WALES.—March 18.—For the following works, for the Pontypridd Urban District Council:—(1) Supply and erec-

WARMINSTER.—March 16.—For building additions to the Buries, Warminster. Messrs. Long & Glass, architects, 53 Market Place, Warminster.

WESTBOURNE.—March 19.—For the erection of office and other improvements at the Westbourne Council boy school, Westbourne, Sussex. Mr. H. W. Stringfellow, architect, Emsworth.

WEST MALLING.—March 26.—For the erection of a caretaker's cottage at the sewage farm. The Sanitary Surveyor, The Limes, West Malling.

WICKFORD.—March 25.—For the erection of a new classroom and other alterations and additions to the Wickford school, Essex. Mr. F. Whitmore, architect, 73 Duke Street, Chelmsford.

WRANGLE.—March 27.—For an addition, alterations and repairs to the Wesleyan chapel, Wrangle, and also for seating in the chapel. Mr. Jas. Rowell, architect and surveyor, Church Lane, Boston.

In connection with the Grand National steeplechase the Great Central Company in past years have made a new departure by arranging to run special express trains including luncheon on the outward journey and tea and dinner on the return, for a most moderate inclusive fare and with such marked success that we notice other companies are following their enterprising example. We observe that the Great Central Company's arrangements for the forthcoming meeting comprise a first-class train leaving London (Marylebone) at 7.25 A.M. on Friday March 22, the fare of 36*s.* 6*d.* including luncheon on the outward journey and tea and dinner on the return. Another train conveying third-class passengers only departs from Marylebone at 7.18 A.M., and the fare of 20*s.* include luncheon and dinner on the train. Accommodation will be reserved on notification being sent to Mr. Monckton, Marylebone station, and the tickets including meals can be had at any time from the Marylebone booking office. On Wednesday, March 20, a special dining-car excursion will be run to Southport, with bookings to Liverpool for three or four days, leaving Marylebone at 1 P.M.; return fare 20*s.*

MARPEDO WHITE JAPAN

SLOW DRYING.

Available for either exterior or interior High-Class Decorative Work, invaluable to Architects, Decorators, Ship and Yacht Builders, Railway Companies, etc. It is easy to manipulate, and large areas can be covered evenly. When dry it presents a hard, brilliant and durable surface, which will not crack. In properly prepared surface one gallon of MARPEDO SLOW-DRYING WHITE JAPAN will cover about 80 square yards. It dries in about 12 hours.

CORRESPONDENCE.

A Durable Building Stone.

SIR,—I have been interested in reading the letters in your last issue. I am not personally acquainted with the Hollington stone, although I believe it to be a good stone for artistic effect, but I have doubts about its use for London. Personally, I have found nothing to equal Portland. I have used in one or two instances a Yorkshire stone and have found it satisfactory; but for all the satisfaction given I am still of the opinion that for the London atmosphere Portland is the best stone for exterior use.

Faithfully yours,

THIRTY-ONE YEARS' (LONDON) EXPERIENCE.

SIR,—Regarding your interesting correspondence as to a durable building stone for thickly populated districts, neither of the replies this week are very convincing. The clerk of works recommends Hollington stone because it has lasted so well in country churches, but although Hollington may be very good, there are many stones one can say that of. According to Professor Church in your

current issue, "London discharges a million tons of oil of vitriol into the air every year," which certainly ought to test anything, and I do not think that anyone can mention a better stone to stand it than good brown Portland. A present I every day see and admire the Mansfield stones in an old Norman minster, with the masonry in a splendid state of preservation, but it would not be the case if there were many acids floating about in the air.—Yours faithfully

ANOTHER CLERK OF WORKS.

SIR,—As Mr. Tunstall's letter of the 8th inst. is likely to convey the impression to your readers, and also to "J. J. M.," that the only quarry able to supply mottled Hollington is Messrs. Stevenson's, I take the liberty of correcting same. There are several others, one of the largest being Messrs. J. & W. Fielding, of Alton, Staffs who are owners of quarries at Alton and Hollington, and numerous buildings in the Black Country are erected out of their stone.

If "J. J. M." is interested in the quality of his steps and landings I should most certainly recommend him to use Messrs. G. Armitage & Sons', Ltd., of Robin Hood, near Wakefield, "Armistone," as being one of the hardest and most durable of all York stones. The reason I mention step stones and landings is that, owing to the open specification so often given in the quantities for these—viz. "hard York stone to be laid on its natural bed," &c.—contractors are compelled to estimate and also use (unless the architect specifies particular quarries) the softest hard York they can procure, which in a great many cases is absolutely unsuitable for the job, especially where there is heavy traffic. This is as much the fault of the quarry-owners as the architect. The former in only a few cases ever take the trouble to put an architect in touch with the various stones they quarry. Now Messrs. G. Armitage & Sons, Ltd., have gone to the trouble of getting over this difficulty by issuing to architects a box of York step stones of different degrees of hardness, with full particulars as regards their uses, and I am certain if "J. J. M." were to write to this firm they would forward him one, which, as regards the York stone trade, is an education in itself.

CATHEDRAL SERIES.—CARLISLE: EXTERIOR OF CHOIR FROM
SOUTH-WEST.

VARIETIES.

Arrangements for the International Building Trades Exhibition are now complete. The opening ceremony will be performed at 12 noon on Saturday, April 6, by the right Hon. the Lord Mayor, Sir William Treloar, the vote of thanks to whom will be moved and seconded by Sir John Webb, R.A., and Mr. F. L. Dove, L.C.C., president of the Institute of Builders, respectively. The exhibition will be open from 10 A.M. to 10 P.M. every week day from Saturday, April 6, to Saturday, April 20, inclusive. A phenomenal success is now assured, for the whole of the Olympia will be taken up by the exhibits, gallery, main hall and annexe having been allotted to their fullest capacity.

The last of the present series of Carpenters' Hall lectures takes place on Thursday evening, the 21st inst., when Professor W. R. Fisher, B.A., will discourse on "Coppice-with-standards and larch woods."

The Harrogate Town Council have resolved to apply for a loan of 34,500*l.* for completing the main drainage scheme at Harrogate. It was resolved to ask the sanction of the Local Government Board to a further loan of 1,000*l.* for completing the Masham waterworks.

An official communication has been received at Portsmouth from the Local Government Board, giving the permission of that authority for the Town Council to borrow the sum of 70,000*l.* for the municipalisation of the South Parade pier.

Efforts are being made to resuscitate the Caithness pavement industry. An influential committee is being formed in London to aid in restarting work at the quarries. From 20,000*l.* to 40,000*l.* per annum used to be paid in wages alone, but the works ceased two years ago.

The *Levant Herald* reports that the Turkish Admiralty propose enlarging the dry dock in the Golden Horn and building a floating dock; also that the Constantinople Prefecture have decided to build six large slaughter-houses in Constantinople and the suburbs, in accordance with plans which have been approved by the Porte.

The directors of the Morecambe Central Pier have decided upon effecting an extensive alteration of their property. The large dancing area at the pier head is to be covered in, and a substantial structure erected, with promenade and roof garden, approached from the pier deck by three separate staircases. The work is to be proceeded with at once.

A REPORT by the Board of Trade shows that the total number of bills deposited for the session of 1907 relating to railways, canals, tramways and the supply of electricity, gas and water is 101, as compared with 151 of the session of 1906; the total amount of money proposed to be raised is 42,380,282*l.*, as compared with 57,949,511*l.*—a decrease of 15,569,229*l.*

The Camberley Urban District Council received thirty-three tenders for the work required in the provision, laying and jointing of cast-iron and stoneware pipe sewers, together with other incidental works in accordance with the plans and specifications prepared by Messrs. Willcox & Raikes. The engineers have been instructed to make inquiries with reference to the lowest tenderers, and to report at as early a date as possible. The tenders ranged from 17,000*l.* to 26,000*l.*

The Lincoln City Council have resolved to discontinue boring operations at Boultham at a depth of 2,200 feet, which it is expected will soon be reached. The bore is now an admitted failure, the water having become worse instead of better since the boring operations were resumed a few weeks ago. The Council have also decided to decline the offer of the South Lincolnshire Water Company to supply the city with Bourne water at a cost not exceeding

3d. per 1,000 gallons. They are now considering a "strictly confidential" report of their waterworks engineer on the future supply of water to the city and district, which embraces details of several schemes.

MR. WILLIAM R. SUTTON, of Sydenham Hill and of Golden Lane, carrier, died in 1900, leaving estate which was resworn in July 1902 at £2,095,850. Mr. Sutton left the ultimate residue of almost the whole of his estate upon trusts to found "Sutton Model Dwellings" in any part of the country, with the condition that, although each tenant should pay some rent, none should be charged full rent. It is understood the trustees are now about to begin by building some blocks of dwellings in London.

"A FORGOTTEN CAPITAL OF THE ORIENT" is the title of a very interesting article in *Harper's Magazine* for March, by Mr. C. E. Russell, who gives a graphic account, which is admirably illustrated, of Fatehpur Sikri, the old capital of Akbar the Great, situated about twenty miles south of Agra. Almost as he left them, the palaces, streets, towers and exquisitely turned minarets still remain, and these stone poems form, it is considered, a fitting monument to the better side of Akbar's character.

A VAST water conservation and irrigation scheme is to be carried out at a place called Barren Jack, on the Murrumbidgee, by the Government of New South Wales. The total cost will be 1,500,000l. The area of the water to be used is 1,000 square miles, from which a main canal more than 150 miles long, with subsidiary channels, is to be formed; these will enable 1,500,000 acres to be irrigated. The scheme is said to be the largest of its kind in the world with the single exception of the dam at Assouan.

At the last meeting of the governors of George Heriot's Trust in Edinburgh the foundationers and elementary education committee recommended the institution of a course in carpentry and joinery for soldiers in barracks at a fee of 2s. 6d. It was explained that the War Office were very anxious to have a scheme to give some technical education, and Colonel Macintosh had said that he had about half a dozen soldiers very anxious to get this instruction, and he would like very much if, as an experiment, they could see their way to take it up. The fee of half a crown would cover the cost of the material, and the

instructor had agreed to give the instruction in his own time.

THE Edinburgh Town Council have considered a report by the electric-lighting and law committees in regard to the claim by the parish council for poor and school rates in respect of the electric-lighting undertaking, from which appeared that the parish council was willing to allow deduction of 24 per cent., while the committee claimed allowances involving deductions equal to 47½ per cent. The parish council, as mentioned last week, had subsequently offered 35 per cent. The dispute is to be referred to the Courts.

THE Hull City Council approve an agreement between the Corporation and the Hull and Barnsley Railway Company by which Parliamentary powers are to be sought for an important scheme for the development of the port. The Corporation are to sell the railway company 15 acres of land and lend them 150,000l. at 3½ per cent. to construct among other things, a pier or landing-stage in the river Humber, to permit of the landing and embarking of passengers by large vessels at low water. The Corporation have previously had a similar scheme passed by the House of Commons but rejected by the Lords.

THE municipal housing scheme of the Clydebank Town Council has caused a considerable amount of friction. After investigation in different parts of the country as to ways and means, twenty-six houses of one, two and three rooms and kitchen were built at Whitecrook, and a ballot took place among selected ratepayers for their tenancy. Some of the ratepayers selected would not enter the houses at all, it being alleged that they were not according to the plan shown. Then those who did remain clamoured for a large abatement on their rent, and it was ultimately decided to remit the first quarter's rent. There has accordingly been a considerable deficit on the first year's working.

THE sub-committee of the Lord Provost's committee of Edinburgh Town Council in charge of the cleaning and renovating of the monuments in the city reported that they had now reached the stage when it was necessary to report to the full committee. Two monuments have been treated one marble, of Allan Ramsay, and the other the bronze of George IV. The cost of the former was 165l. and of the

er 45/. The sub committee decided to recommend the Provost's committee to proceed with the other monuments, but in the case of the Scott monument, if it is dealt with, it is suggested that the figure should not be treated in the solution that has been applied to the Allan Ramsay monument.

THE question of providing additional filters and clearer tanks is engaging the attention of the Edinburgh and District Water Trustees. With the multiplication of buildings at a high altitude the question of these filters being constructed at a higher level than those of Alnwickhill has been considered. Mr. Hill, Manchester, consulting engineer, was called in to consult as to the advisability of providing these, and to advise as to the places where they could be placed, has strongly recommended the provision of additional filters, and a remit has been made to him to make borings of different places in the vicinity of Fairmilehead, and he will present a report to the Trust as to the one he recommends. The cost, it is expected, will amount to about 150,000/.

A CROWDED meeting of the owners and occupiers of the property in the City of London was held in the Aldhall last week to protest against the proposals in the Metropolitan Water Board's "Charges" Bill now before Parliament. The Lord Mayor, who was attended by the sheriffs and the civic officers, presided during the first part of the meeting. The following resolution was adopted unanimously:—"That this meeting of owners and occupiers of business premises in the City of London strongly protest against the provisions of the Metropolitan Water Board (Charges, &c.) Bill in Parliament, introduced by the Metropolitan Water Board, which Bill, while professing to be only a measure for equalising the rate to be charged for water throughout the metropolitan area, will in effect enormously increase the rates at present levied for water supplied to business premises in the City and elsewhere.

COMPARATIVE costs of various paving materials have been obtained by the streets and buildings committee of Edinburgh Town Council. The first cost of granite setts (with bedding) is 11s. 6d. per superficial yard; whinstone setts, 8s. 3d.; hard wood blocks, 15s.; compressed rock setts, 12s. 6d.; tar macadam, 6s.; and ordinary

macadam, 3s. 9d. The total period of life, with expenditure, per superficial yard, is in the case of granite setts, thirty-five years, 15s.; whinstone setts, twenty-five years, 11s. 3d.; hard wood blocks, fifteen years, 17s.; rock asphalt, twenty-two years, 18s. 6d.; tar macadam, fifteen years, 7s. 3d.; and ordinary macadam, ten years, 4s. 7d. The gross average cost per annum of granite is 5d. per yard; whinstone, 5½d.; wood, 13½d.; asphalt, 10d.; tar, 5½d.; and ordinary macadam, 5½d. In the cases of granite and whinstone there is a deduction of 4s. and 1s. 6d. respectively, as the value of paving for re-use in side streets, leaving a net average cost of these materials of 3¼d. and 4¼d. respectively.

MR. PETER TAWSE, one of the most extensive contractors in the North of Scotland, died in Aberdeen, in his fifty-third year, on Friday. He commenced business on his own account in Aberdeen in 1896. His first contract was the paving of Schoolhill Viaduct, followed by similar work on Rosemount Viaduct and Union Terrace. Among his other contracts in the city were the low-level sewer, the construction of the electric subway, the first section of the high-level sewer from Point Law to Skene Street; and in the district, the Waterton and Dyce waterworks, the extension of Peterhead waterworks, and sewerage and water schemes at Laurencekirk, Strichen, Banchory, Culter, &c. He also carried out large street contracts in Dundee, Forfar, Perth and Arbroath. His greatest work was the Girdleness outfall sewer, with the tunnel under the Dee and through St. Fittick's Hill, this and the electric light costing 130,000/. At the time of his death Mr. Tawse had on hand contracts representing an aggregate sum of 150,000/., amongst which are the Donside sewage scheme and the new pontoon dock for Aberdeen.

THE bridges and roads committee of the Kent County Council reported as follows:—Material for main road repairs, 1907-8. (a) Imported material.—Your committee have by advertisement invited tenders for the supply of 72,000 tons of hard material. Seventy-four tenders were received from sixty-four contractors. For 1906-7 the quantity tendered for was 70,630 tons, and the number of tenders was sixty-nine from sixty contractors. The competition is therefore a little greater this year.

TRADE NOTES.

THE Titan sprinkler proved its efficiency in a fire at the factory of the Prince of Wales Spinning Company, Oldham. Very little assistance was required from the fire brigade.

A LARGE striking clock with three dials is to be erected upon the new Co-operative Society's buildings in Mansfield, and is being made by John Smith & Sons, Midland Clock Works, Derby.

THE London and Lancashire Insurance Company having arranged to meet the requirements of the new Compensation Act, have prepared a useful epitome of the essential points of the Act, defining respectively the liability of the employer and the benefits to the employé. The elaborate rules of procedure, &c., are omitted.

THE Patent Indented Steel Bar Co., Ltd., have received a cable from New Zealand notifying them that the jury of awards of the International Exhibition now being held at Christchurch have awarded them a gold medal for their exhibit, this award being the highest that could be obtained. This is the third gold medal that the indented steel bar has been awarded at international exhibitions.

SCOTTISH NATIONAL EXHIBITION.

MATTERS have so far progressed in connection with the Scottish National Exhibition of 1908 that the Executive are now in a position to invite architects to lodge competitive designs for the buildings. In the conditions of competition it is pointed out, says the *Scotsman*, that the Exhibition buildings are to be erected on the north-eastern section of Saughton Hall grounds, lying to the south of the Saughton golf course. The buildings for general exhibits are to be not less than 100,000 superficial feet, and for machinery and exhibits in motion not less than 20,000 superficial feet. A concert-hall, seated for 2,000 persons, is to be provided for, with space for a large orchestra and organ. The fine arts building is to have not less than 1,500 lineal feet of wall-space, and to be capable

of extension to 2,000 lineal feet. One of the conditions is that the total cost of the buildings is not to exceed 20,000 exclusive of electric light, gas, water and other supply pipes. Taken as a whole, the area of the buildings for exhibits is to be somewhat similar to the area occupied by the buildings of the 1886 Exhibition. There will be two principal entrances—one at the car terminus at Gorgie by the proposed Corporation bridge over the Water of Leith, and the other from the Balgreen Road, at the north-east corner of the grounds. The designs are to be in the hands of the secretary not later than May 11, and the authors of the first and second designs are to receive each a premium of 100l., the author of the third getting 75l. The assessor is Mr. John J. Burnet, A.R.S.A., F.R.I.B.A., Glasgow, who was one of the architects for the buildings of the 1886 Exhibition. The grounds consist of the fine old park and gardens of Saughton Hall, picturesquely situated on the Water of Leith, and are admirably suited for the purpose of an exhibition, the Water of Leith being available for aquatic displays, while the numerous trees will lend themselves to lighting effects by night. The grounds extend to about 50 acres, nearly double the extent available for the 1886 Exhibition, so that there will be plenty of space available for all purposes, more especially for sports. A grand stand capable of accommodating 1,500 will be erected at the sports enclosure, which will be on the west side of the ground. Mr. W. H. Knight, the manager, is at present in London in regard to the music and other entertainments. Between sixty and seventy designs for posters have been lodged, and the committee are to meet on Thursday to select two of these, for which prizes of 50l. and 20l. are to be awarded. The designs, two of which are from Paris, are to be on view in Edinburgh on Friday and Saturday.

ARTERIAL DRAINAGE IN IRELAND.

THE report of the Vice-Regal Commission on Arterial Drainage in Ireland states that the Commissioners recommend (1) the formation of a Government Drainage Department, whose functions should be to define the boundaries of the several catchment basins in Ireland, ascertain the

ure, extent and cost of the drainage works required rein, determine the constitution of the body which shall responsible for the maintenance of works when executed, and be the guardian for the expenditure of public money; (2) the creation of conservancy boards for the large or "major" catchment areas, which should have charge of the main outfall works and exercise control over subordinate drainage committees in their area with a view to securing harmony, action and unity of purpose; (3) drainage committees for small or "minor" catchment basins and for drainage districts in the large watersheds. These latter would be largely under the control of the County Councils. In dealing with this complex and difficult problem the Commissioners have framed their proposals to meet the following tests:—Will they enable new drainage districts to be formed in a simple and economical manner; will they meet the after-effects of all districts existing and to be formed, large and small; will they provide for the security and repayment of Government loan for the accurate determination of the increased value of the improved lands and for the expedited acquisition of land and water rights? And the answer to each of these questions will, the Commissioners hope, be found in the affirmative.

A NOTE ON HOUSING OF THE WORKING CLASSES.*

is is essentially not a paper dealing with the whole question, but merely a note, or perhaps it would be better described as an appeal for further consideration on the question of the advantages and disadvantages of block dwellings and cottage tenements, more particularly relating to towns.

There are certain places which contain unsanitary, insanitary, and dirty areas, which, for every reason, it is desirable should be cleared. The only thought given to the cleared sites is, that they should again be used for so-

* A paper by Alban H. Scott, M.S.A. (medallist), read at a meeting of the Institute of Sanitary Engineers and published in the *Journal*.

called model dwellings. Upon these valuable sites expensive buildings are erected, known as model block dwellings, the cost being about 60s. per person accommodated, and about 8s. 6d. to 9s. 6d. per foot cube; this is taking a moderate estimate.

Every acre takes about 1,100 persons. Roadways or playgrounds 40 feet wide are provided between each block of buildings; this is not a great advance for the twentieth century, and no doubt these 40 feet roadways or "playgrounds" were only provided when they were found absolutely necessary to give light for a six-storey building. The sanitary accommodation, being used in common, is most undesirable.

The rents charged are 3s. to 4s. 3d. per room, and about 12s. per week for four rooms inclusive, the return on the capital being a fraction under 4 per cent. Taking the plans of a block such as those just mentioned, we find that the single rooms are planned to act as living-room and bedroom, the food cupboard being placed close to the foot of the bed. The superficial area of this room is 150 feet.

In the two-room tenement the plans show living-room of about 150 feet sup., and bedroom of 120 feet sup., containing one double bed, one single bed and a cot, the room containing cubical capacity of just over 1,000 feet, or about 250 feet cube per person—not so much as they allow in our prisons and workhouses, nor so much as the L.C.C. demand for a common lodging-house; and please be it always remembered that these premises are designed for constant use, and occupied by working families.

If one of the occupants is ill, can you conceive a more undesirable place to reside, with summer temperature and four people sleeping in a room of 120 feet super.?

It must also be kept in mind that such tenants as occupy these premises can never get away for a holiday. They are kept pent up winter and summer always in the same condition, just a 40-foot roadway or "playground" surrounding their dwellings.

This is a fair description of the usual style of "model" block dwellings.

The cottage tenements usually consist of two floors—ground and first—giving accommodation for two families, separate entrance being provided for each family, and also in some cases, as at those excellent cottages built at

ARTHUR L. GIBSON & CO.,

19, 20 & 21 TOWER STREET, UPPER SAINT MARTIN'S LANE, LONDON, W.C.

Battersea (Latchmere estate), providing also a separate entrance to a back garden for each tenant, the cost being 7d. per foot cube and 61d. per room. These premises were built by direct labour, paying full wages, and include cost of artesian well, roads, sewers, &c. Everything here tended to run up the cost, and yet the scheme pays, with reasonable rents—10s. per week for four rooms with bath, scullery, and 7s. 6d. per week for three rooms and bath, scullery, the rentals being 2s. 6d. per room, and bath, scullery added in.

The accommodation provided on this estate is for about 200 people per acre, or, if you exclude the recreation ground, the accommodation is about 267 people per acre.

Why have block dwellings when there are hundreds of acres to sell, freehold, at 500l. per acre, within eight miles from the Marble Arch—if this is so in London, other large cities must be more fortunate—places served by at least three railways, with good train service and very cheap workmen's tickets?

The Acts allow the authorities to build outside their own district, and yet they will continue to build these "model" block dwellings in the heart of confined and unhealthy districts, providing no gardens (always remembering they do provide the miserable "playgrounds" 40 feet wide).

What would be the cost of a housing scheme within the distance above-mentioned?

For calculating purposes we may take the area as being an estate of 15 acres. Allowing three acres for recreation ground, we get the following figures:—

Capital Outlay—

15 acres of land at 500l. per acre	£7,500
300 tenement cottages each accommodating two families, cost of same being 400l. per house	120,000
Cost of roads, sewers, artesian wells, fences, &c.	9,000
Sundries	3,500

Total cost £140,000

Income—

300 houses (two tenements), each floor consisting of three bedrooms, living-room and bath, scullery and separate conveniences, let at 6s. per week per floor of four rooms and scullery = 12s. per house per week	£9,360
---	--------

Expenditure—

Repairs, loss of rent, insurance	6,000
Repayment of loan and interest, calculated at 4 per cent. for loan for sixty years. Rates, &c., at 6s. in the £	9,360
Collection, caretakers and superintendence	1,500

Income	£9,360
Expenditure	7,860
Net profit per year	1,500

Showing a good net profit, which is quite sufficient for municipal enterprise.

In the above figures I have taken the following broad principles, which I consider should govern all buildings for the working classes:—

1. Not more than 250 persons per acre of land.
2. No building should be more than two floors high.
3. Every tenement should have a garden adjacent to the house.

As shown above, no financial difficulty need arise, and there is no doubt that the present system of block dwelling is most unsatisfactory both from the physical and mental point of view, and the idea of providing small cottages with a plot of garden attached to each is an excellent one—or which ought to appeal to the mind of everyone.

It is much to be regretted that in these days, notwithstanding the rapid strides science has made, one of the three very essential factors for our existence in health, for some reason or other, is grossly neglected among many people—perhaps for the sake of supposed economy, but which however, in the long run proves to be otherwise.

One of the causes of consumption—the disease which accounts for thousands of deaths annually—is the want of this neglected factor—fresh air. It is true that a certain germ is the direct cause, but the predisposing cause is the lowered vitality of the individual. And yet how many do know that to this state a person must be brought before the disease can attack him? While fresh air is essential to the building of the tissues, and so increasing their power of resistance, impure air, on the other hand, acts conversely on the system, lowers the vitality of an individual, and

renders him liable to all the various forms of disease of which this world is so full. The importance of fresh air cannot better be illustrated than the open-air treatment which is now being adopted all over the world in cases of consumption, and it is not much to say that in the treatment of all diseases fresh air is of prime importance.

It seems a false economy to erect block dwellings, which only serve as a breeding-ground for disease to supply the sanatoriums which are being built at enormous cost.

Fresh air is as much a necessity as food, but it cannot be obtained to one's best advantage in a house, no matter how ever well ventilated that house may be.

In view of the great important part alone which this nature plays, as already illustrated, the theory of a small garden should receive the unanimous support of all.

Moreover, the garden has some other part to play than to give us the wholesome air, for its delightful face of green mingling with the forms and colours of nature serves a new charm for us in our perception. The influence of the forms and actions in nature is so needful to man that, in its lowest functions, it seems to lie on the confines of commodity and beauty. To the body and mind which have been cramped by labour, nature is medicinal and restores their tone. The workman comes out from the confines of impure air, out of the din and craft of the street, to the open garden, where he breathes the reviving atmosphere, and sees the sky and works of nature, and is a man again. In their eternal calm he finds rest, refreshing to the body and pleasing to the mind. Again, to those who thirst for knowledge, as nature is the incarnation of a thought, it turns to thought again, every moment instructs, and every object, for wisdom is infused into every form.

It may be stated that the moral influence of nature upon every individual is that amount of truth that it illustrates to him.

Mr. Rider Haggard, in giving evidence before the select committee of the House of Commons on the Housing of the Working Classes Acts, stated that at a place near Waltham, Essex, twenty men had only a shed to sleep in, and lived winter and summer under an elm tree. Personally I could much prefer this system of "housing" to the block dwellings. The men living under the tree were healthy and strong. Pray, how many out of twenty men living in

block dwellings would be in so good a condition? It certainly does sound like housing on the lines that cattle are housed, but it is preferable to be thus accommodated than like so many bales of wool and other goods, stacked floor above floor, in every sense similar to a warehouse; no privacy, no home life, nothing to take an interest in and driving, as it of necessity must, the people to seek diversion in the gin-palaces and other undesirable places. To fully understand and appreciate the pleasures of living in block dwellings, one should spend at least twelve months there. You would find that existence is almost impossible without week-ends in the country and good long holidays.

No parks or public open places will ever make up for the lack of pure air and brightness immediately around the dwellings. They are most desirable and necessary. We must not, however, counteract the beneficial results arising from them by building unsuitable dwellings 50 to 65 feet high, with only 40-foot roads or "playgrounds."

There are some excellent examples of cottage tenements in addition to those already mentioned. Those at Camberwell are provided with a small garden. The Artisans, Labourers and General Dwellings Co., Ltd., have done some excellent work at Noel Park, Wood Green; the houses have small gardens, and it is pleasing to see that in some cases the elevations have received more consideration than usual. The Peabody Trust have also good examples (the pantries in some cases have no proper ventilation).

The L.C.C. have erected some good cottages at Tooting. Unfortunately the area at back is very small. (I must add here that the L.C.C. have certainly added to the architectural beauty of London by their model dwellings.)

At Southampton cottages have been built at a cost of 67l. per room, whilst their ugly, undesirable block dwellings cost over 116l. per room. The cottages have most satisfactory elevations.

At Eastleigh the L. and S.-W. Railway Company are providing houses for their employes. The gardens are most pleasing, but the elevations might have had some further consideration. (The food cupboards have no proper ventilation.)

As far as Manchester is concerned, every member here should take the opportunity of seeing the houses at Blackley Estate. It is particularly satisfying to observe that the

elevations have had consideration; but why no proper ventilation to food cupboards?

Port Sunlight should be carefully examined as an excellent model for country housing. No one can realise the excellent work done by Mr. Lever, M.P., without an inspection of his work at Port Sunlight.

In conclusion, may I express my most sincere hope that block dwellings are a thing of the past? They can be conveniently converted into good warehouses. No money need then be wasted.

EXTENSION OF MESSRS. BRABY'S SHOW-ROOMS.

At the galleries of Messrs E. & C. Braby, 7 & 9 Grape Street, Shaftesbury Avenue, W.C. (New Oxford Street end), there is a very interesting exhibition of wares arranged as far as possible according to the Tudor, Jacobean, Georgian, Renaissance and other notable periods, so as to give visitors ample opportunity of inspecting the various suites of mantels, grates, curbs and hearths appertaining thereto, as well as the ornaments and accessories in keeping therewith.

Our representative was invited to attend the private view on Thursday, the 7th inst., and among the more important exhibits may be mentioned a fine specimen of a Louis XV Genoa green marble chimneypiece, richly carved, with an inlaid marble hearth; also two fine specimens in statuary marble—one of these fitted with a steel and brass grate—the whole having been specially designed by one of our most eminent architects. Then there is a striking original design of a Jacobean fireplace with bold yet simple lines, the main feature of which is a successful treatment of the chimney-breast, also showing the way in which a room may be panelled in an inexpensive manner. The interior is set in a margin of jasper marble, and a fine specimen of a dog grate of the period is placed on a raised marble hearth with an embossed hand-made copper curb and canopy.

Another noticeable specimen is an original design of a briquette hob fireplace, with special wrought-steel bars, the curbs and briquettes being of Dutch blue marl tiles, the upper part of which is arched over the fireplaces, the

mantels being of white wood. There are also several fine examples of bright steel dog and Georgian hob grates, reproduced from some characteristic designs. In the inner room a pleasing specimen of a Dutch fireplace with antique tiles is shown, set in dark-wood panelling, with a rich blue filling, the whole having a most restful effect; also three Tudor suites, each fitted with bright steel dog grates and specimens of the Georgian and Renaissance period, specially designed. On the first floor we noticed a unique exhibit of quaint ingle-nooks and cosy corners, suitable for hall, drawing and dining-rooms, specially designed for use in country cottages and bungalows. Separate show-rooms are reserved for "L'Art Nouveau" style, including specimens of the Glasgow school, and also for the more ordinary requirements of middle-class houses and offices. In the basement are specimen marble and tile-lined bath-rooms, fitted complete. An original and pleasing effect is given in the latter case, the floor and dado being of a rich red unglazed tile, and the upper part in non-reflective tiles of a delicate green tint, relieved with bands of orange.

Messrs. E. & C. Braby have been fortunate in securing the co-operation of the well-known firm of Messrs. J. Barker & Co., of Kensington, who have contributed greatly to the success of the exhibition in providing antique furniture and ornaments, thus imparting to the whole an artistic effect.

It is evident that great pains have been taken by a concerned in making the exhibition thoroughly representative, and visitors, who are cordially welcome, will have every facility offered them, we are assured, for inspecting the high-class goods referred to, which are adapted to the most varied tastes.

EXCLUSION OF GROUND AIR.

In the autumn, winter and spring months, and during the nights, even in summer, says Dr. Pettenkofer, the air in our houses is warmer than that contained in the soil beneath. The house acts like a suction-pump in such cases, sucking up the air within the soil, and with it the poisonous gases and germs with which it is infested. An explanation of the great prevalence in cities of epidemic diseases such as diphtheria, typhoid and scarlet fever, during the winter months, when the purity of the air is supposed to be

THE "DRAWWELL" GRATE

WAS PLACED

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORCKER, Ltd.

GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.

London Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent, where the "Drawwell" can be seen in action

test, is furnished by this simple induction. By in-
quiries conducted during a number of years, the
ctor has shown that the soil beneath our feet is saturated
h air, carbonic acid and microscopic life to a considerable
th. He has also discovered that the "ground air" and
organisms are constantly sucked up and that germs of
eases ripened in the earth may be brought into our
odes or exhumed and wafted for miles by the wind.

Basements should, therefore, says Mr. J. L. Smithmeyer
the *Inland Architect*, never be used as sleeping-rooms,
cause, aside from the detrimental effects of the ground air
erted most effectively in that portion of the house, the
es and moisture which during the day under the influence
the sun ascend to a considerable height, descend to the
face during the night, so that the atmosphere near the
l in great cities in the night time may be said to be
saturated with carbonic acid and such other gases of decay
sulphuretted and carburetted hydrogen, and sulpho-
drates of ammonia and other impurities, together with
nutely divided particles of living matter, capable of
minating and producing disease. These products taken
gether constitute what is now known and dreaded under
e name of "malaria."

Dr. Wales, ex-surgeon-general of the United States
y, appointed in 1884 a board of doctors and scientists to
amine the site for the new Naval Observatory in
ashington, D.C., with regard to its sanitary aspects. The
ort of these gentlemen is very exhaustive, and in it
ey use this language, viz. :—"Extended observations have
en made by the board upon the composition of the
ound air, a department of sanitary surveys which has
t received a great deal of attention hitherto. Wherever
ter does not stand, as ground water, the interstices of
e soil are occupied by air, and as the ground water rises,
s air is forced up into cellars and basements and becomes,
aspiration into the warmer parts above, the air of our
uses. Should the soil contain tracts impregnated with
composed organic matter covered over by innocuous
rth, as is the case often in made lands, air charged with
ensive gases or deleterious organisms is likely to be
ced up in this way from considerable depths and may
count for the occasional occurrence of epidemics which
not otherwise be explained."

We know now that the soil to a considerable depth is a
perfect nursery of microscopic forms of life, and is constantly
charged with carbonic acid, and that by the suction exerted
by the currents of air in contact with the surface, this
ground air, with its myriads of organisms and its dele-
terious gases, is being constantly exhumed and brought into
our houses.

A striking illustration of the results of the incursion of
ground air into dwellings was published in New York City,
viz. :—

"In one of the most elegant quarters of the city of
Brooklyn, an instance occurred which attracted the atten-
tion of the medical profession to a wider extent than
generally happens in such cases. A gentleman by the
name of Rockwell, having amassed a fortune in business in
this city (New York), decided to erect a residence for his
family on Brooklyn Heights, which should be perfect in every
detail of convenience and sanitary arrangement. No expense
was spared; no modern appliance of plumbing or trapping
neglected; no device of sanitary engineering, as concerns
ventilation or sewerage, forgotten to render the 'Rockwell
mansion' a model to be copied by future residents on the
heights. The ground was naturally supposed to be dry and
apparently well drained, and so no measures were taken
either to abate the normal moisture of the soil or to cut off
and prevent the rising and percolation of the ground
air. The house was finished and the family, consisting of
Mr. and Mrs. Rockwell and two little girls, aged respectively
ten and twelve and a boy seven years old, moved into it,
anticipating many years of pleasure, ease and happiness.
Within one year every member of the family had been
conveyed to the 'Rockwell plot' in Greenwood, dying one
after the other in rapid succession of the disease easily
recognisable as directly produced by malarial poisoning.
A medical inquiry followed, and disclosed the fact that,
owing to the neglect of the fundamental precautions (against
the ground air) the very perfection of the appliances for
ventilation, by exerting a stronger suction on the ground
air and its gases than a less carefully constructed and
plumbed arrangement would have done, had precipitated
a catastrophe it was intended to avert."

That air, soil and water greatly influence the develop-
ment of various diseases, especially "typhoid fever, diph-

theria, grip and cholera," is now universally accepted, and that the propagation of these diseases must be ascribed to the pollution of air, soil and water. The part which water takes in this important hygienic process is too vast to give it here more than a passing notice and an illustration.

Dr. Fodor's extensive experiments in the city of Budapest, Hungary, show the immediate detrimental effects which the overflows of the river Danube have upon the people who live in inundated districts. He also shows the striking correspondence between the varying heights of the river and the ground water in the adjacent soil, and the respective sanitary condition of the people during these periods, and he concludes from all this that the rise of the river checks the drainage of the ground water, sewers, &c., and forces it back to fill and pollute the wells and springs, and to permeate the entire inundated district with these organic substances, and to saturate this polluted soil to the extent of repletion. The ground water, when driven back, forces the organic and effete matter, unwholesome gases and disease germs to the surface, and forces the ground air out of the ground into the atmosphere or into our abodes, carrying with it a great deal of noxious moisture, gases, organic substances and disease germs.

Dr. Fodor has devoted many years to the study and investigation of the sanitary condition of Budapest, the capital of Hungary. He made many and very valuable discoveries, whereby he was enabled to solve some of the sanitary problems incidental to the appearance of certain diseases in certain localities, under certain conditions of the soil, and at certain periods of time.

Judging from the doctor's description of that city, we detect enough similarity between it and numerous cities in this country including Washington (the capital of the nation) to admit of our deriving high benefits from his investigations.

If the soil of a city or town is largely porous like that of Budapest, and a good portion of it lies low and close to rising and falling water, that portion is subject at times to partial and at times to total inundation, and naturally brings about the same conditions which exist in Budapest on the river Danube.

Every high rise of the adjacent water or excessive rains drive this decomposed organic matter (in the soil) to the

surface, and expels the "ground air," which thus escapes from this mass of deleterious substance into the atmosphere and into the dwellings of the inundated districts.

Enough has been said to prove the existence and harmful nature of the ground air. The question which presents itself to the architectural mind is, "How can the harm done by this air be reduced to its minimum?" The ready answer is, "By averting all contact with it as much as possible, especially in our abodes."

True, the laws of nature cannot be changed, but by the exercise of intelligent observation they may be made subservient to our purposes. Thus, by means of a simple and comparatively inexpensive device the "ground air" can be averted from entering our abodes, hospitals, schools, houses, &c., and its harm reduced to a minimum, if not wholly abated. Nor does this device require special skill or cost or attention; on the contrary, it is very simple, works continuously and automatically, and lasts as long as the building will last.

As the ground air (beneath our inhabited structures) follows the warmer air in the houses above it, there should be a suitable sized "air space"—an "air chamber"—interjected between the ground (from which this air emanates) and the basement floor. This air chamber should be provided with suitable air-tight ventilating flues "built" in the walls, starting at the bottom of these air chambers and extending as high above the top of the house as the chimneys, so as to carry this bad air (by aspiration) beyond the reach of harm. The effectiveness of this device will be greatly enhanced by building these ventilating flues adjacent to the smoke flues, or between. These ventilating flues will not only carry off the ground air but also the poisonous gases and odours from the leakage of "waste" and "sewer" pipes buried in the soil beneath our abodes, and will also greatly aid in keeping the house dry. Acting automatically (as they will) they will not require any attention to keep them in working order.

It is the duty of the architects and builders to bend their energies toward the erection of buildings (especially dwellings and hospitals) which would secure safety and comfort to their occupants as well as health, and it seems incumbent on the municipal authorities to make suitable regulations for the protection of its citizens from that source of harm.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

* * * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

NOTICE.

Next Friday being Good Friday, THE ARCHITECT will be published on Thursday. All advertisements intended for this Number must reach the Office not later than 4 P.M. on Wednesday, March 27.

No alteration of advertisement copy can be allowed after Saturday morning, March 23.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. Gill, town clerk, Town Hall, Birkenhead.

DUDLEY.—March 30.—For a free library in St. James's Road. Competitors must be practising within 50 miles of Dudley. Mr. H. C. Brettell, town clerk, Town Hall, Dudley.

FAILSWORTH.—March 28.—The District Council invite designs for a library (cost not to exceed 3,000l.) in Oldham Road. Premiums of 20l. and 10l. Deposit one guinea. Mr. H. C. Broome, clerk, Council Offices, Failsworth.

SUNDERLAND.—March 30.—New church and halls for the Presbyterian Church of England in the Side Cliff Road, Roker, Sunderland. Premiums of 25l. and 15l. respectively. Lithographed plans of site, &c., on application to Mr. George W. Bain, 46 John Street, Sunderland.

CONTRACTS OPEN.

AMBLESIDE.—March 28.—For the whole of the various trades and works in connection with grammar school. Messrs. Walker, Carter & Walker, architects and surveyors, Windermere.

TRADE NOTES.

MESSRS. JENRICK & Co., of No. 23 Bucklersbury, E.C., in the City of London, and Ringstead Works, Catford, Kent, shop-fitters, shop-front builders and decorators, request us to state that they are still trading at above addresses and that they are in no way connected with any other firm who have been recently trading in any name similar to above.

A LARGE clock is to be erected in the tower of Kirklington Church, Yorkshire, striking the hours and showing time upon one dial. The order has been placed with Messrs. J. B. Joyce & Co., Whitchurch, Salop, who are just about to ship two large clocks to Bucharest.

THE "Carron" steam-cooking apparatus has been adopted for the Addenbrook hospital, Cambridge.

THE recent additions to the Willerby asylum have been warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues, Manchester grates and special inlet and outlet ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE new automatic fire protection system of Messrs. Merryweather & Sons, Ltd., which secures an efficient supply of water to the highest floors of a building, has been adopted at Messrs. Smith & Son's new premises, Kingsway. On Thursday the system was examined by several experts.

THE Borough Council of Deptford have been unable as yet to avail themselves of Mr. Carnegie's gift of 18,000*l.* for the building of a public library, as a site was not obtainable. There are now hopes, however, that one may be secured shortly.

At Erendon, Warwickshire, a building for parochial purposes, costing 600*l.*, is to be erected as a memorial to the late Marchioness of Hastings.

IN connection with the Census of Production Act, the President of the Board of Trade has appointed a general committee to advise upon the general scope of the census and the lines upon which the information required shall be obtained. Other committees, who will consider the special requirements of particular trades, will shortly be appointed, consisting of leading manufacturers and nominees of their associations. Committees for the building, iron and steel, cotton, woollen and worsted, engineering and shipbuilding trades are at present in course of formation.

At the Central Police Court, Glasgow, last week, Police-Judge Martin heard a complaint against one of the Corporation servants in regard to the smoke nuisance. Alexander Gerrard, works manager of the Coplawhill Tramway works and stores, was charged with having, between the hours of twelve noon and one P.M. on February 26 caused or allowed smoke of unnecessary density to be emitted from the works. He pleaded guilty, and was fined 10*s.*, with the alternative of seven days' imprisonment.

SUMMER DRIED SEASONED BATH STONE FOR WINTER USE.

CORRESPONDENCE.

A Durable Building Stone.

SIR,—As I have had considerable experience as regards the durability of stone in the Midlands and North Wales, I must say that I consider if Hollington and Alton stones are able to withstand the chemically-laden atmosphere of the Midlands they are capable of withstanding anything. It hardly seems to be borne in mind by your correspondent that both Hollington and Alton stones are quarried in three colours, viz. mottled (shaded), red and white. In the post office at Hanley, recently erected, I believe white Hollington was used.

I quite agree with your correspondent, Mr. Booker, as regards the open specifications now existing in the market of York stone, and I am thankful to hear one York stone firm has had the good sense to put architects in touch with the stone they quarry.

F. M. SILVERS KENT,
Building Material Specialist.

SIR,—May we be allowed a space in your valuable paper, in justice to Mr. Tunstall and ourselves, to correct the statement of Mr. George Booker, quarry agent, Driffold, Sutton Coldfield, in your issue of March 15, stating that there are several firms owners of mottled Hollington stone quarries, knowing perfectly well, as Mr. Booker does, that we are the sole proprietors of the mottled and red Hollington stone. We have practically inexhaustible deep beds of this fine-grained red and mottled stone, which is being very extensively used, especially in the Burton-on-Trent district, and if these stones can withstand the acids of this most destructive district surely there is no further proof of their durability necessary. We shall be delighted to have the opportunity of submitting samples, together with a list of jobs we have supplied, to anyone interested.

—Yours faithfully, JNO. STEVENSON & SONS.

Hollington, near Tean, Stoke-on-Trent:

March 18, 1907.

SIR,—Would you kindly permit me to add the following to my letter of the 13th inst? In correcting Mr. Tunstall's statement I referred to Alton stone, which is in the neighbourhood of Hollington, the strata and geological formation

being the same as Hollington, one of the finest examples of mottled Alton being the restoration of Hereford Cathedral under Mr. J. O. Scott. Messrs. Stevenson wish me to state they are the sole proprietors of the mottled Hollington referred to. In making the statement I did my wish was not to disprove Messrs. Stevenson's statement, but to draw attention to a similar stone in the neighbourhood for the benefit of the readers of your paper.

Driffold, Sutton Coldfield:

GEORGE BOOKER.

March 21, 1907.

VARIETIES.

THERE will be a performance by the Royal Choral Society at Albert Hall on Good Friday, at 7 P.M., of Handel's "Messiah" (with original accompaniments). The band and chorus will number 1,000, under the leadership of Sir F. Bridge, M.V.O.

THE Stepney Borough Council declined by 30 votes to 16 to adopt a minimum wage of 30s. for all the able-bodied workmen employed by the Council. The estimates of the Council for the year 1907-8 show a decrease of 14,789l., as compared with the previous estimates.

MR. THOMSON, burgh engineer for Dundee, has been instructed to prepare sketch plans in connection with the proposed town hall, embodying the idea of retaining the present building, but extending it east to Tyndal's Wynd and west to Crichton Street, and providing a new city hall at the back. Shops may also be provided.

THE Glasgow Liberal Club on Friday accepted plans for new premises to take the place of the present buildings at the corner of St. George's Place and Buchanan Street. The plans show a building six storeys in height, built in a simple form of Renaissance in white freestone. The premises will be occupied entirely by the club. At present the floor accommodation extends to 17,164 square feet, while in the new building it will be 32,804 square feet. The cost is estimated at 22,000l. by the architects, Messrs. Campbell Douglas & A. N. Paterson, St. Vincent Street, Glasgow.

THE medical officer for the Northwich urban district in his annual report says that to house the nation properly

ld decrease the mortality by more than half; it would ease infectious disease by three-fourths, would sweep away nearly all the anæmic, undersized, scrofulous beings crowd the slums, almost stamp out tuberculosis and very much at one stroke to elevate the moral and mental element of the bulk of the people and lessen the need of workhouses, prisons, asylums, sanatoria, epileptic colonies and hospitals. He adds that slums cannot be got rid of until better houses are provided, and that the remedies for slumdom are to reform existing houses, to break the erection of slums by the jerry-builder and to provide houses of a proper character for those who need them. Private enterprise having failed to house the people, public organisations must undertake it. The preliminary step is to obtain land, and then it would be immaterial who built the houses, provided their erection was supervised. LORD SALVESEN last week closed the record in an action for the instance of William Pollock, contractor, 166 London Street, Glasgow, against the Eastern District Committee of County Council of Dumbartonshire. The pursuer asks for 10,649*l.* 18*s.* 11*d.*, said to be due to him in connection with the construction of the Bearsden sewage scheme, completed by him in July 1897. The contract price was 7,162*l.* 6*s.* 3*d.*, but the pursuer avers that in the course of carrying out the scheme the original plans were materially departed from by the defenders. The sum sued consists of (1) 8,034*l.*, the balance of the sum brought in the measurement after allowing for payments on account amounting to 7,479*l.*; (2) 500*l.* deposited by the pursuer in security of his carrying out the contract; (3) interest on that sum, 15*l.* 18*s.* 11*d.*; and (4) 2,100*l.*, being the total of various additional claims. The defenders plead that the pursuer, having assigned all his claims under the

contract, has no title to sue the present action. They admit that during the progress of the work certain alterations were from time to time made in particular portions of it as occasion arose, but they say that none of these alterations constituted a material divergence from the work specified in the specification and tender. In October 1903 the defenders offered to the pursuer 1,000*l.*, and also the amount in the deposit receipt, 500*l.*, in full settlement of his claims. This offer is repeated on record under reservation of all their rights and pleas. The case was sent to the procedure roll.

For visiting Holland and Germany during the Easter holidays the Great Eastern Railway Company's British Royal Mail Hook of Holland route offers exceptional facilities. Passengers leaving London in the evening and the northern and midland counties in the afternoon arrive at the chief Dutch cities the following morning. A corridor train with vestibuled carriages, dining and breakfast cars is run on the Hook of Holland service between London and Harwich. From the Hook of Holland through carriages and restaurant cars run in the North and South German express trains to Cologne, Bâle and Berlin, reaching Cologne at noon, Bâle and Berlin in the evening. Special tickets at reduced fares have been arranged by the Harwich-Antwerp route for passengers wishing to visit Brussels for the Field of Waterloo. For the convenience of passengers, tickets dated in advance can be obtained at the Liverpool Street station continental inquiry or booking offices. The Danish Royal Mail steamers of the Forenede Line of Copenhagen will leave Harwich for Esbjerg (on the west coast of Denmark) on Monday, March 25; Thursday, March 28; Saturday, March 30; returning Tuesday, April 2; Wednesday, April 3. The General Steam Navigation Company's steamers will leave Harwich on March 28 and 30, returning March 31 and April 3.

To the vast numbers who with jaded nerves and flagging energies are seeking resuscitation in the way of restful and health-giving change from the activities of city life during the ensuing Easter recess the A.B.C. Easter programme just issued by the Great Central Railway Company will strongly appeal. Within its covers are conveniently tabulated an almost unlimited choice of resorts suitable for all tastes and requirements. On Wednesday, March 27,

excursion facilities are announced to over sixty Irish ports and inland towns. The arrangements for Thursday, March 28, cover nearly 250 seaside and inland resorts extending through the Midland Counties, Yorkshire, Lancashire, Lincolnshire, North-east and North-west coasts and North of England generally. The trains are equipped with buffet cars, enabling meals to be served on board at a most reasonable tariff. The special expresses leave Marylebone at convenient times and arrangements have been carefully made to shorten the journey of the long-distance traveller by bringing his destination as near London as possible in point of time. For those who cannot leave until late on Thursday an extra fast train is provided, departing from Marylebone at 12.5 midnight. Special trains will also be run on Good Friday, Saturday, Sunday and Monday (Bank Holiday). Other noticeable features of the programme are the issue of Saturday to Monday week-end tickets; frequent day and half-day facilities to the beauty spots of Middlesex, Herts and Bucks; bicycle and pedestrian tour tickets; extension of the week-end ticket arrangements, &c. Copies of this comprehensive publication may be obtained at Marylebone station, company's suburban stations, town offices or agencies, or from Publicity Department, 216 Marylebone Road, N.W.

MESSRS. FARNHAM, LTD., of Caxton House, Westminster, have been awarded a contract for the cleaning of the frontage of the older portion of the Glasgow Stock Exchange facing Buchanan Street and St. George's Place, and for the subsequent treatment of this frontage, and of the frontage of the new portion of the building, by the Farnham patent paraffin wax process. Considerable decay has taken place in the stonework of the older portion of the building, and signs of commencing decay are already showing on the new frontage, which was only completed a few years ago. Glasgow architects will no doubt watch with interest this first important piece of work in their city which is being carried out by Farnham, Ltd. There has been so much evidence in recent years with regard to the deleterious effects of the Glasgow atmosphere on stonework, and so many efforts have been made, without much success, to preserve stonework in Glasgow from the action of the atmosphere, that the result of the Farnham treatment will,

no doubt, be carefully watched by all Glasgow architects interested in the subject. The treatment consists in the drying out of all moisture from the stonework and filling the pores of the stone to a considerable depth with pure molten paraffin wax, which sets hard in the pores of the stone, and remains permanently unaffected by acid or alkali. No moisture can again penetrate the stone, and therefore the cause of decay is removed. After the paraffin-wax treatment the surface is cleaned off by the Farnham sand blast process, so that the fabric is clean and no deposits remain on the surface.

NEW CATALOGUES.

ANYTHING relating to the productions of Messrs. Peckett & Sons, of Bristol, cannot fail to be interesting, for the works of these shops are models. When so many businesses are in the hands of temporary directors, it is satisfactory to have one on a grand scale which is under the direct supervision of the proprietors. In consequence Messrs. Peckett can claim many improvements in their engines. The principle of standardisation which is now so much recommended as if it were a discovery of a commission, has been long adopted in the Atlas Works, for all parts of the engines "are made to standard gauges and templets, every locomotive being interchangeable with all others of the same size and class. As Messrs. Peckett have many customers among contractors, with whom time is money and who cannot have relays of locomotives to meet contingencies, they felt themselves bound to create supplies which would be equal to every demand. The views of the works are enough to give confidence to everyone who invests in a locomotive and thinks of accidents to it. Locomotives have to sustain more wear and tear than those in the service of contractors, and in consequence the coming from Messrs. Peckett are pictures of strength as well as of simplicity of construction. It is hardly necessary to say many other varieties are produced in addition to those for contractors. Some are used on branch lines and light railways, and the qualities of Messrs. Peckett's locomotives are put to the test in quarries, collieries, gas works, &c. The catalogue presents photographs of several types

ocomotives, and there are also views of the different departments of the Atlas Works. As a thorough English business for the supply of genuine and substantial locomotives, Messrs. Peckett's is entitled to preference before foreign establishments.

A new catalogue descriptive of their hand lifts has been issued by Messrs. R. Waygood & Co., Ltd. Those who suppose that hand-power is very limited will be surprised to find what can be accomplished by it when aided by ingenious mechanical aids. A warehouse lift is equal to 10 cwt. to 10 feet, while a slanting lift for cellars can lift from 12 cwt. to 20 cwt. along the sides of steps to a vertical height of 10 feet. But weight lifting is not the only consideration. Steadiness is often the most important quality, as in hospital and infirmary lifts, lifts for invalids, passengers, furniture, dinners, &c. A common nuisance in the streets arises from the clumsy and tedious manner of rolling down beer-barrels to public-houses. For 12l. 10s. Messrs. Waygood can supply a portable lift which would finish the inconvenience to passers-by. The use of this apparatus should be made compulsory by local authorities. There are also lifts for raising pianos, carriages from basements, and, in fact, Messrs. Waygood have adapted appliances to suit all requirements, whether commercial, manufacturing or domestic.

P. & W. MACLELLAN, LTD.

The directors' report for the year ending December 31, 1906, states that the net balance at credit of profit and loss account, after providing for bad and doubtful debts, directors' fees, percentage of surplus profits due to managing directors and certain officials, and including the balance from last year of 4,482l. 19s. 11d., is 66,654l. os. 3d. Deducting therefrom the year's interest on Debentures, 6,750l.; amount transferred to depreciation account, 7,500l.; and to reserve fund, making it 70,000l., 17,500l.—31,750l.—there remains a balance of 34,904l. os. 3d., from which the directors recommend the payment of the dividend on the Preference shares 6 per cent., absorbing 9,000l.; dividend of 6 per cent. per annum on the Ordinary shares, absorbing 9,000l.; the payment

of a surplus dividend of 3 per cent. on both the Preference and Ordinary shares, absorbing 9,000l., leaving a balance to carry forward to next year of 7,904l. os. 3d. The dividends will be payable in two equal instalments on March 30 and September 30 next. The works, machinery and plant of the company have been upheld during the year, and all renewals and repairs charged against revenue. The directors regret to report the loss since the last general meeting, through death, of their colleague Mr. James M. Blair, who had occupied the position of a director since the formation of the company. The directors have appointed Mr. Grahame H. Thomson, a son of the former deputy-chairman, a director of the company. The directors retiring are Mr. J. Hamilton Turner and Mr. Grahame H. Thomson, who offer themselves for re-election.

BUILDERS' ACCIDENT INSURANCE.

The twenty-sixth annual meeting was held on the 6th inst. Mr. T. F. Rider presided. The secretary, Mr. C. M. Brown, having read the minutes of the last general meeting, the Chairman said that since 1898 they paid in claims between 130,000l. and 140,000l., besides returning some 28,000l. to insurers in rebates, and the fact that the funds now available are over 22,000l. shows a record with which the directors have a right to be satisfied. The increased and extended liability under the Workmen's Compensation Act, 1906, is receiving the most careful consideration of the directors with a view to arriving at an estimate of the increased cost, and with the experience of twenty-five years under the present and previous Acts to guide them, they feel sanguine of being able to fix rates of insurance which will be satisfactory to their members. The Chairman moved the adoption of the report and accounts.

The resolution was seconded by Sir John Mowlem Burt. On the motion of Mr. Thos. Hall (Hall, Beddall & Co.), seconded by Mr. Woolf (J. & H. Cocks, Ltd.), the retiring directors, Mr. Woodman Hill, Mr. A. Krauss, Mr. Wm. Nicholson and Colonel G. H. Trollope, V.D., were unanimously re-elected.

Mr. Wall moved that the directors' fees be 600l. for last year, as in previous years.

The motion was seconded by Mr. F. G. Minter, and agreed to unanimously.

Mr. Chas. Fox, F.C.A., was re-elected auditor of the company.

Mr. Sharman proposed a vote of thanks to the Chairman, which Mr. Thomas Hall seconded. Mr. Charles Wall supported, and it was carried by acclamation.

The Chairman returned his thanks.

Mr. Bartlett (Messrs. Perry & Co.) proposed a vote of thanks to the secretary and the staff.

Mr. Sapcote (Birmingham), as representing the provinces, seconded the resolution.

Mr. C. M. Brown (secretary) returned thanks for himself and the staff.

GRANITE-TOP MACADAM.*

UP to the year 1899, Oak Park had been striving to get a street pavement which would fill the conditions for a residence suburban town as to cost, general appearance and durability. Prior to the above date pavements had been constructed of limestone macadam, cedar block in the business district (which has since been displaced by brick), and two streets of asphalt. The curbing used in a majority of the above pavements consisted of limestone in 6-foot lengths, 30 inches in depth, hammer-dressed to 12 inches on the face and 6 inches on the back, and to a thickness of 4 to 6 inches.

The difficulties arising from the pavements existing at that time was mainly this:—The limestone macadam streets were constructed with insufficient crown and ground up rapidly under the action of traffic, and were exceedingly dusty if not properly sprinkled. Cedar block pavement was expensive at almost any cost, and especially so at 1 dol. per yard, when the life of the pavement did not exceed seven years, and the abutting property was compelled to stand a second assessment to replace the old cedar block. It may be well to state at this point that at that time the Board of Local Improvements of Oak Park refused to consider any

* A paper read before the Illinois Society of Engineers and Surveyors by R. A. Carpenter.

petition from property owners for paving with cedar block. Asphalt pavement, while desired by a few residents, did not meet with general approval from the fact of its being too expensive and a possibility in a very few years of being badly cracked up, this giving the street a very untidy appearance and also lessening the life of the pavement.

Under the conditions as herein briefly set forth, the first ordinance was drafted for paving Euclid Avenue, a distance of 2,200 feet, with a granite-top macadam pavement. The roadway on this avenue was paved to a width of 30 feet between face of curb and included the gutter flags, which were combined with the curb.

The curb and gutter was constructed on a bed of cinde 8 inches in thickness. The curb was 7 inches in thickness with an average height of 12 inches, and combined with gutter flag 18 inches wide and 6 inches thick. The curb exposed at the summits of the gutter was 4 inches, and 8 inches at the outlets of the gutters. The combined curb and gutter was constructed from Portland cement, fine granite screenings and crushed granite in proportions of one part of cement, two parts of granite screenings and four parts of crushed granite. One inch on top of gutter flag and roadway face of curb was composed of one part cement and one part of fine granite screenings. The curb and gutter was laid in 6-foot sections, and the corners of street intersections were rounded to a radius of 6 feet and at all public alleys rounded to a radius of 1½ foot.

The roadway between the gutter flags was excavated to such a depth and in such a manner that after the subgrade had been thoroughly rolled with a steam-roller of not less than 10 tons weight, and after the different courses of material had been placed thereon, the finished pavement in the centre of the roadway would be 6 inches above the top of the curb, giving an average crown of 1 foot in 30 feet.

On the sub-grade the first course was composed of macadam limestone bonded with limestone screenings, and measured 8 inches in depth over the entire roadway between gutter flags after rolling. On top of the 8-inch course macadam was placed a layer of medium limestone bonded with limestone screenings, measuring not less than 4 inches in depth over the entire roadway after rolling.

On top of the 4-inch limestone course was placed a layer of medium crushed granite, on top of which was

placed sufficient bonding gravel to thoroughly fill all interstices, and as the rolling was in progress the roadway was thoroughly drenched with water and the rolling continued until all water placed upon the pavement would seek the gutter, indicating a thoroughly bonded pavement. The course of granite measured not less than 3 inches over the entire pavement after rolling.

On top of the bonded granite course was placed a layer of pea granite $\frac{1}{2}$ inch in thickness over the entire roadway and the whole roadway thoroughly rolled, compressing so far as possible the pea granite into the bonding gravel. The gutters were then thoroughly cleaned by brooms and the entire street barricaded for one week to thoroughly dry out and harden. At the expiration of one week the avenue was thrown open to traffic, and for seven years has required no maintenance further than cleaning and sprinkling, and has always been perfectly satisfactory to the abutting property owners who paid for the improvement.

At the time the Euclid Avenue paving was completed there were many residence streets in Oak Park ready for improvement. A large majority of the petitions received by the Board of Improvements for paving streets in Oak Park since that time have been for granite-top macadam, with the request that the specifications be the same as Euclid Avenue. Many streets up to the present have been paved in this manner, approximating 250,000 dols., including those constructed by special assessment and private contracts.

Experience has shown there are a number of points to be observed in constructing granite-top macadam pavements in order to give the best results.

First, it is advisable, where it can be done, to make a system out of each special assessment and pave all streets, both ways within the district comprising the system, and thus avoid so far as possible the mud from unimproved streets being deposited on the pavement. A single paved macadam street extending into a district where all the cross streets are unimproved will be injured more from the mud of the cross streets being deposited on the paved streets than from all the traffic on the street in ordinary dry weather. It will further be found where a single street is paved in an unimproved district, traffic (both heavy and light) will in nearly all instances go considerably out of the

way in order to take advantage of a paved street, which is unfair to the owners of abutting property who have paid for the improvement.

Second, one of the very important questions in constructing granite-top macadam streets is to give plenty of crown, 12 inches on a 30-foot roadway is none too much, and also to be sure that the rolling is continued long enough on the granite course to insure the street being thoroughly bonded.

Third, one of the mistakes that is often made in constructing streets of this character is in using too much bonding gravel. A great deal of care should be exercised in spreading the gravel (and especially so when the gravel is wet and chunky), otherwise it will be found patches will appear where the gravel is greatly in excess and other places where there is an insufficient amount to receive a bond. Any overplus of gravel on a street when opened for traffic will cause the pavement to mud up badly during wet weather and dust in dry weather. The least amount of gravel that can be used and still have all interstices filled will give the best results, and cause the least trouble on maintenance in the future.

The average estimated cost per square yard on granite-top pavements in Oak Park is 1.35 dols., and granite curb and gutter 70 cents per lineal foot.

ART TRAINING OF THE POTTER.

A MEETING of the Midland Association of Headmasters of Schools of Art was held at Burslem last week. The members of the Association who attended first paid a visit to the pottery of Messrs. Doulton & Co., Ltd., where they were given an opportunity of inspecting the various processes in connection with pottery manufacture. Subsequently they assembled in the lecture theatre of the Wedgwood Institute, where Mr. Stanley Thorogood (headmaster of the Burslem School of Art) read a paper on "The Art Training of the Potter."

According to the *Staffordshire Advertiser*, he said probably there was no craft dealing with the arts which was more fascinating, interesting, and so full of difficult problems as that of potting. Here they had to deal with a plastic material that might be treated in an endless variety of ways ;

it might receive the roughest treatment or the most delicate handling imaginable, and practically all the known forms of expression might be embodied in one work. It provided scope for the scientist, artist, modeller and designer, and the processes—both scientific and artistic—were so numerous that one would indeed have to be a genius to master them all in a lifetime. Although the scientist was always making discoveries, the problem of firing and the effect of varying temperatures were so intricate that they were never thoroughly solved and were always a source of anxiety to the potter. Possibly there was no district in the country where there was greater need for a school of art from a practical point of view than in the Potteries. They were surrounded by craftsmen and young people whose very livelihood depended on a knowledge of art in some form or another, and he was pleased to say that within recent years many advances had been made in the direction of recognising the importance of the art training given in their schools. As illustrating the general awakening to the importance of art education in the district, he might point to the co-ordination of the elementary and art schools which was taking place in each of the five Pottery towns, but while this system could not fail to have a beneficial effect on the workers in the staple trade, he hoped that the day was not far distant when authorities and public alike would look more broadly on art education.

In this age of machinery and commercialism, it was impossible to deal with this subject without first of all considering what was demanded of those they were called upon to train. One felt that the great work of the twentieth century, so far as many of the artistic crafts were concerned, was to educate students in the principles of art, to inculcate a practical knowledge of the manufacturing conditions imposed by machinery, and to endeavour to introduce artistic beauty into machine-made productions. However distasteful to the artist, they must accept the commercial conditions, for machinery had come to stay. Lovers of pure handicraft might regret to learn that quite 90 per cent. of the products of the Potteries were machine made, but it nevertheless was a fact. Take, for instance, that interesting craftsman, the thrower. While he might have the opportunity of being a great artist, commercial conditions almost turned him into a machine. Many might imagine that

students studying form and designing shapes might take a piece of clay and evolve a shape directly on the wheel, and this no doubt would be an ideal method, and one that would appeal to the artistic craftsman, but he feared it was impracticable and to a certain extent useless in a school of art. In the first place, to throw a shape that was practicable, in other words one that would fire, was one of the most difficult feats imaginable and one that required years of practice in order to become expert. Then, further, few throwers for first-class work were required in the Potteries, and even their work was almost entirely confined to throwing from shapes already designed for them on paper. Unfortunately, however facile a thrower he might be, he was rarely if ever called upon to design shapes directly on the wheel, and this was regrettable, seeing how suggestive of fine form was this means of production.

Again, in the case of the ordinary pottery modeller, many of his methods were mechanical and required extreme care. The pottery decorator, however, dealing with first-class hand-painted work, was, in one sense, not so limited. It was true he must know his palette, and it required some years of experience to become an expert in the application of colour and to learn the effects of the fire, but an unerring draughtsman and colourist had endless opportunities of applying his knowledge in every conceivable way. There was practically little limit to his modes of expression, and in spite of the difficulties with certain colours, very charming colour schemes were obtainable. In face of commercial conditions, they had a difficult task in the matter of teaching and applying correct methods, for one feared that, with few exceptions, there was at present little demand for work representative of the best principles.

They had not yet produced a public that had the taste to appreciate it or the knowledge to distinguish between good and bad in art. They might be offended and bewildered by the motley conglomeration of forms and styles and incongruous colour schemes to be met with on many articles of utility, and also by the free use of cheap, gaudy naturalistic transcripts from nature that were strewn over shapes, regardless of the contour, but they were told that the public created the demand and that the manufacturer must cater for it. While it must be admitted that improvement in public taste was necessary in order to advance

pottery design, yet it could not be denied that if the manufacturers were more prone to place before the public pottery of a more artistic character, the demand would in time be created. At the present time one was able to find furniture, wall-papers, hangings, tiles, carpets and other requisites for the equipment of the house of really artistic merit, and one could only assume that the better taste in this direction had been influenced by manufacturers persistently producing work of a higher artistic order than heretofore. Amongst the more important of those requiring artistic education in the potting industry were tile draughtsmen and designers, pottery decorators, modellers, designers, engravers, moulders and turners, and the question arose what was the best and most efficient educational means of training such craftsmen, taking into consideration their limited amount of time and having regard to the commercial conditions. This led to the all-important question of technical instruction in their schools of art.

It was true that some few years ago they might have been accused of not sufficiently applying their studies to the various artistic crafts, but he feared they might soon have to consider if the pendulum had not swung back a little too far. In their eagerness to be practical were they not in grave danger of overlooking the fact that, in the first place, good draughtsmanship and a good general art training were of vital importance to the craftsman in whatever craft he might be engaged? Certainly the very nature of the requirements of the art worker in the Potteries demanded, first and foremost, that he should have a liberal education in all matters relating to art, and, above all, that he should be a good draughtsman. This being the case, it meant that the first four or five years of the student's time at school should be devoted entirely to the study of art and draughtsmanship in general, independent of any specialising and he thought the same should apply to every craftsman. Given a student who had devoted his time to serious study, and was well acquainted with plant and animal life, the laws and principles of ornament, the history of art and architecture, and who had learnt to become a good draughtsman, and, in other words, had received the liberal education which it was the first duty of a school of art to give, he would soon turn his hand to any craft, whatever it might be. There were many workers who were extremely skilful

—as far as their technical work was concerned—in their own narrow sphere, but the two things they lacked were knowledge and good draughtsmanship.

In saying this, he did not underestimate the importance of craftwork, for it was manifestly essential that students designing for any process should be thoroughly acquainted with their material before attempting to design in it. But craftwork was undoubtedly popular, and to many afforded a royal road. This tended to make the student feel that he could run before he could walk, and was analogous to the art student who desired to paint difficult subjects before he could draw. Much of the so-called craftwork executed under these conditions was amateurish and feeble, and as useless as a factor in art education as the copying from lithographs, which was common in some schools of art years ago. It would be understood that they had abundant opportunities of taking up technical work in their schools in the Potteries, and they did their utmost to apply their teaching to the staple industry, as was evidenced by the amount of potterywork they executed in material. But the exceptionally intricate technical nature of potting made it very difficult to carry out work in its entirety in a school of art, particularly in connection with the firing of large works. Again, while many of the processes were easily taught in a school, it must be remembered that the majority of workers to whom a knowledge of processes would be useful were fairly well acquainted with them, and indeed had spent practically the whole of their time on the technical side in the factory. Consequently, what they required from the school of art was the training he had endeavoured to indicate.

In consideration of the fact that they were surrounded by factories and that the manufacturers were willing to help them, it was a question if it would be advantageous to go in for any elaborate system, as without doubt the ideal situation for a school of art, so far as its technical work was concerned, was really on the factory. One of the most important questions they had yet to deal with in that district, as in many others, was with regard to apprentices. It was somewhat unfortunate that the old system of apprenticeship was not now in vogue, as it placed many obstacles in the way of their training, and again, the fact must not be overlooked that the majority of them were

wage-earners from the moment they left school. With a few exceptions, the whole of the apprentices' time in the day was devoted to the technical side, leaving only the evenings for their special artistic training, with the result that they rarely had the opportunity to study the very branches of work which would be most useful to them, such as plant and animal life and colour harmonies. An ideal system of training would be for apprentices during the first few years of their apprenticeship to devote half their time to the school of art, studying in a similar manner to students at the art trade schools of the Continent. Certainly, it would give them an opportunity of receiving a good groundwork in subjects which it was impossible to teach in the factory. He feared that if anything was to be done a system of scholarships would have to be devised, and it would have to be looked upon from a national point of view if they were to have any permanent arrangement. Certainly advances would have to be made in this direction if we were to compete with other nations. At the conclusion of his paper, Mr. Thorogood gave demonstrations of various ceramic processes, principally in connection with the production of tiles.

ELECTRICITY IN EDINBURGH.

A LECTURE was delivered last week by Mr. F. A. Newington, resident electrical engineer, on "The Electricity Supply of Edinburgh." He began by tracing the development of electricity, noting the first arc lamp of Sir Humphry Davy in 1813, and the simultaneous production in 1880 of the incandescent lamp in this country and America. Of the incandescent lamps with filaments made of some of the rarer metals the best known were the Nernst and the Santalum lamps, and the latter, or something similar, would, he believed, be the lamp of the near future. By it he demonstrated the light could be increased 44 per cent. with a reduction of about 8 per cent. in one's bill. The development of electrical apparatus for heating, cooking and other domestic uses was noted, and the lecturer afterwards proceeded to trace the progress of the Edinburgh undertaking. For the first two years the price for electricity for power purposes was 3d. or 3½d. per unit, but at that rate electricity

was not able to compete with steam or gas-engines. As soon as the price was reduced to 1½d. per unit people quickly realised that the electric motor was an exceedingly convenient machine for producing mechanical power. For the first year (1895) only 68 horse-power was in use, whereas now the amount was 8,200 horse-power, an increase of about 120 times in eleven years. Speaking of the electricity undertaking of the city, he said that the machinery first erected at Dewar Place station amounted to 1,700 horse-power, and the increase in the demand for electricity had continued with fair regularity ever since. In 1906 the horse-power installed amounted to 20,000—that meant that the machinery had increased nearly twelve times in eleven years. The buildings at M'Donald Road station as they stood at present would contain about 18,000 horse-power of machinery, but the site was sufficient for double that amount. After describing the plant at the two stations he said that at the present time there were about 35 miles of feeders, 110 miles of distributing mains and 50 miles of high-tension mains throughout the city. Arc lamps were largely used for lighting the streets of the city, the number at present in use being 1,137. The length of streets so lighted was about 40 miles. At the commencement the price charged was 20d. per lamp per annum, but the rate had been reduced year by year until now it was only 9d. That price included supplying and erecting the lamp and post, trimming and maintenance, and electricity. He thought that was about the lowest rate in Great Britain. The quantity of electricity used for street lighting now amounted to about 1,500,000 units a year. Dealing with the progress made during the twelve years of working, he pointed out that in 1895 there were 479 consumers, and now they numbered 10,000. In 1895 the lamps connected were 57,400, and now they were 431,000. For lighting, in 1895 electricity cost 6d. per unit, and at present it was 3d. per unit. The price for power in 1895 was 3½d. per unit, and it had fallen steadily to the present rate of 1½d. per unit. The total surplus up to May 15, 1906, amounted to 118,600l., of which 90,600l. had been invested as a reserve fund, and the remainder, 28,000l., had been used in the reduction of the general rates of the city. On the motion of the Chairman, cordial thanks were awarded to Mr. Newington for his lecture.

EDITORIAL NOTICES.

One of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. NEW CATALOGUE.

THE interesting brochure issued by the National Fireproofing Company on "The Correct Construction of Fireproof Buildings" is an explanatory and illustrated catalogue of their system. The numerous photographs suggest the variety of conditions under which the system can be applied. An essential feature is the use of porous terra-cotta hollow tile blocks of various shapes, which serve for the construction of floors and for the protection of the girders. The two photographs showing the effect of fire on girders and other steelwork which were not protected are a most effective argument than can be expressed in words of the risks incurred by an excess of confidence in steel by itself. The strength of the material may not be increased by any covering as regards the sustaining of loads, but as a covering either prevents or delays the contact between flames and metal, in that way there is an important gain. If girders and cross-bearers once succumb the fate of a building is not far off. The appreciation of the National Fireproofing Company's system by insurance offices is suggested by one building which used to be charged as if it were in a large measure made of wood, but when reconstructed was charged at the low rate of 16 cents. In that case there was little steel introduced, for the hollow-tiled blocks can be made to serve for floors by their unaided strength.

THE annual meeting of the Association of Municipal Corporations is announced to be held at the Guildhall on Thursday, April 17.

THE Birmingham City Council having agreed to erect cottage baths in certain wards of the city, it has been decided to build a suite in Coventry Street as an experiment. A site 197 yards in extent has been acquired adjoining the land presented by Sir Alfred Gooch for the purposes of a playground. The baths will comprise six for men and five for women, and the estimated cost of the suite is about 2,000*l*. If the experiment is successful baths will be erected without delay in other districts.

TRADE NOTES.

THE new Council schools, Gosport, are being warmed
and ventilated by means of Shorland's patent Manchester
stoves, the same being supplied by Messrs. E. H. Shorland
Brother, of Manchester.

WE are informed that the Carron Company of Carron
Shire, have obtained the contract for supplying the
whole of the catering departments at the forthcoming Irish
International Exhibition to be held at Dublin with their
"Carron" gas, steam and coal-cooking apparatus.

A NEW edition of Haworth's "Practical Timber
Measurer and Timber Buyers' Tables" has appeared.
Although it costs only a shilling, it contains the tables and
data which are most often required in transactions with
timber and other materials.

WITH the object of more clearly defining the different
interests of the members of the firm, and with a view to
further development, Messrs. Oetzmann & Co. are regis-
tering their business as a joint-stock company with a
nominal capital of 100,000*l.* There will be no initial public
issue, but should any of the capital be offered to the public
at a future date, preference will be given to customers. To
ensure continuity of the policy which has been so success-
ful during the past sixty years, the company will retain the
services of the partners of the firm as directors.

ACCORDING to the annual report the business of Sir
William Arrol & Co., engineers and contractors, has been
satisfactory. The net profits earned last year amounted to
3,841*l.*, as against 32,081*l.* for 1905, on the company's

capital of 300,000*l.* The dividend is maintained at 10 per
cent., and over 11,000*l.* is allowed for depreciation and
reserve, while the carry-forward is again over 8,000*l.*

VARIETIES.

THE Edinburgh Town Council have agreed to the
recommendation of the electric-lighting committee that
application be made to the Secretary for Scotland for
consent to borrow 85,000*l.* for capital works for the two
years to May 15, 1908.

THE Town Council of Galashiels have given notice of
their intention to apply to the Secretary for Scotland for a
provisional order for the purpose of dealing with the drain-
age of the burgh, &c. It is estimated that the scheme will
cost from 60,000*l.* to 70,000*l.*

LORD KELVIN has been nominated as president-elect of
the Institution of Electrical Engineers for the session
1907-8. The Council has also elected Professor J. J. Thomson,
Cavendish Professor of Experimental Physics at Cambridge
and Professor of Physics at the Royal Institution, London,
an honorary member of the institution.

THE carpenters, bricklayers and painters in Coventry
recently applied to their employers for an augmented rate
of wages and an alteration of their rules of working. The
subject has been under consideration by the Masters' Asso-
ciation, and it was decided last week that it should be
referred to arbitration.

THE housing committee of the Battersea Borough Council
report that the local municipal housing estates are not pay-
ing their way, although nothing was paid for the sites and
the houses were erected by the Council's works depart-
ment. It is proposed to raise the rents of three-roomed
tenements from 7*s* 6*d.* to 8*s* per week, and of five-roomed
houses from 11*s* 6*d.* to 12*s* per week. The total estimated
receipts from the Council's two estates are 8,165*l.*

THE Croydon Gas Company has repeated an offer made
two years ago to light a section of the town with gas free of
charge for six months, in order to demonstrate that the
town can be saved a penny rate as against the arc electric
system. The semi-official reply of the Corporation's elec-

tricity committee is that the new form of electric lamps coming into use will eventually mean a reduction of the cost of that form of lighting by one-half.

A DEPUTATION of slate manufacturers and others from North Wales waited on Mr. McKenna and Mr. Lloyd George at the House of Commons last week. The deputation was introduced by Mr. Ellis Davies, who referred to the serious loss of employment in the district owing to the giving up of the use of slates in many schools. Mr. McKenna, replying, reminded the deputation that the case was not so simple as it appeared, for they had to deal with the report of the inspectors, who, he said, generally reported against the slates. He sympathised with the manufacturers, and he promised to give the matter further consideration to see what could be done, and the inspectors would also be asked to reconsider the question. He thought, perhaps, something might be done, especially as regards rural schools, where the sanitary objection did not apply as in the large city schools.

THE annual general meeting of the shareholders in the Stancliffe Estates Company, Ltd., was held at the registered offices of the company at Stancliffe last week, Mr. H. C. Heathcote, J.P., C.C., the chairman of the Board, presiding. Among the directors present were Mr. J. H. Dawson (managing director), Mr. Tom Wright, J.P., Mr. B. Morton, J.P., Mr. C. H. Glossop, J.P., and Colonel H. Brooke-Taylor. This was the eleventh ordinary meeting of the Company, and the directors, in submitting their report, had the pleasure of announcing continued success and prosperity, and the declaration of a dividend at the rate of 5 per cent. per annum, free of income-tax, besides the carrying forward to current account of over 2,000l. The report was unanimously adopted. The retiring directors were Mr. H. B. Taylor and Mr. C. H. Glossop, who were unanimously re-elected. Messrs. Marshall, Gibbon & Co., of Manchester, were re-elected auditors. On the motion of Mr. C. E. Dawson, seconded by Mr. M. W. Smith, a cordial vote of thanks was unanimously passed to the directors for their services during the past year.

THE British Consul in Morocco states that the country requires roads, bridges, telegraphs, railways and canals; in the past many attempts have been made by individuals and

corporations to secure contracts for such work, but they were unsuccessful because they were suspected of concealing political designs under the guise of business. The Algeiras conference has unlocked the door of Morocco to enterprise, and has made it clear that all public works are to be tendered for in the open market, and a State bank is to be established, which will watch over the administration of finances. There is to be no favouritism, and it follows that contracts will go to those people who have gone to the expense and trouble of making themselves thoroughly acquainted with the labour character, climate and other conditions of Morocco. Private individuals are likely to build extensively in the near future, and everything appertaining to the building trades may find a market, but the orders are not likely to go to the United Kingdom unless the trades concerned combine to send out shrewd and tactful experts to take stock of local requirements and conditions, and to make acquaintance with the men on the spot who could assist them to obtain business. Catalogues alone will not attract orders.

BATH STONE FIRMS.

STONE from different quarries belonging to the Bath Stone Firms, Ltd., has been employed in various buildings now in progress. The extensive additions to the master's house at Eton College are in Monk's Park stone. For the memorial building to Old Etonians, stone from the Combefield quarries, Portland, is used. The New Post in Newport is also of their Portland stone. The walls of St. Paul's Presbyterian church, Enfield, are built of Kentish rag with Monk's Park dressings. For the Carnegie Library, Bridgend, South Wales, Monk's Park stone is used, as well as for the County Court and Inland Revenue offices, Swindon, St. Luke's Church, Well Hall, Eltham, the Wesleyan church, Cheam Road, Sutton, and the Wesleyan chapel and schools, Penarth. The Royal Exchange Building, of which Messrs. Ernest George & Yeates are architects, is of the firm's Portland stone. Their Corsham Down stone is to be seen in St. Paul's Church, Leyton, while Monk's Park and St. Aldhelm Box ground was employed for the Presbyterian church and schools, Kensington, Liverpool.

THE METRIC SYSTEM.

THE Decimal Association have received a letter signed by Mr William Mather on behalf of Mather & Platt, Ltd., of the Salford Ironworks, which says:—"We are strongly in favour of the general, and in time the universal, use of the metric system, and believe that its adoption will be of great benefit to the trade of the country, not merely on account of commercial relations with other countries using the metric system, but also because we regard it as a more scientific and exact system of weights and measures, and therefore leading to greater accuracy in thought and greater precision in calculation, which so largely concern all engaged in engineering developments. But we think that the measure making adoption of the system compulsory within a short time, under severe penalties, would be a source of no little hardship to many businesses, and lead to it probably to resistance and temporary dislocation of trade. Less draconic measures and persistence in endeavours to enlighten the public will, we believe, more readily attain the end in view, and without the drawbacks which must accompany drastic legislation.

"We think the most practical steps are to urge the Government to adopt the metric system in the national arsenals and dockyards and in such businesses as the Post-office. The effect would be far-reaching and immediate. In the second place, we would urge that greater prominence should be given to the metric system in the teaching in our elementary and secondary schools; and lastly, that all possible steps should be taken to co-ordinate such movements in this country with similar endeavours in the United States. We have no sympathy whatever with the schemes which have been discussed of late to decimalise our present standards. . . . We introduced the metric system in its entirety in our works in 1901 for all new lines of work and have adhered to it since."

The new Baptist church at Market Harborough was opened on Monday, 25th inst. The building, which is designed in Late Gothic, accommodates 543 persons. The joinery is of fumed oak. The architects are Messrs. George Jones & Son, 5 Clement's Inn, Strand, London, W.C., and the builders, Messrs. H. Herbert & Sons, of Leicester.

A NEW FIRE-DETECTOR.

EVERY device which is a means of preventing fire and therefore safeguarding loss of life and the destruction of property should be welcomed. A new instantaneous fire-detector is being manufactured by the Leslie Walker Fire Alarm Company, Gamage Buildings, Holborn, E.C. This alarm has numerous points of superiority over the thermostatic alarms hitherto in use. It reports a flame at the earliest possible stage and gives a second alarm if the burning continues; at the same time being quite immune from false alarms, it automatically compensates for slow normal variations of temperature, whereas no abnormal rise of temperature can occur without instantly causing the instrument to give the alarm. To take an example. Supposing this detector is installed in a place which is often heated up, but is at present cold—say a few degrees below freezing-point: if something catches fire suddenly raising the temperature to freezing-point, the signal will already be rung although the detector is ice cold. A thermostat of the ordinary type, on the other hand, in a like instance, would have to wait till the fire extended and warmed up the thermostat's sensitive part to a pre-determined degree (generally 130 degs. to 160 degs.) before it would act.

In any building installed throughout with the Leslie Walker system, should a fire, even so small as may be caused by the burning of a newspaper in any part of the premises occur, a warning is instantly given locally and sometimes at a distance on a bell, and the exact spot where the fire has occurred is shown on an indicator. This first call is termed the "caution call."

Should the fire not at once be extinguished, then a second call is given either on a gong or gongs outside the building, and also, where permitted, direct to the fire-station. This signal is called the "danger alarm." The action of the instrument will, however, be better understood if we refer to the engravings, figs. 1 and 2 above. In these fig. 1 illustrates the detector as it appears complete and fixed to the ceiling of a room. Fig. 2 shows the apparatus in an inverted position with the outer case or covering removed. At the lower part of the engraving is the base for fixation to ceiling and furnished with terminals to which the conducting wires are connected, and which also secure the

FIG. 3.

rectangular springs which carry a cradle on which is attached the vital part, viz. a mercurial instrument with a horizontal bulb described in detail below. The latter appears in the upper part of this engraving. The three springs mentioned serve the double purpose of conveying the current to and from the contacts of detector and also of forming buffers which it is claimed entirely protect the instrument from harm, rendering it invulnerable to concussions or vibration.

The tube is shown in detail in fig. 3, referring to which the bulb A, with very thin walls, is filled with mercury and exposes a large surface to the atmosphere. The part B is a very fine capillary tube, which conveys the mercury from A to the compensating chamber C, this chamber being partly filled with mercury. At the point D a platinum wire is fused into the tube A and is always in contact with the mercury, and at E and F are two platinum wires fused into the normally empty contact-tube, which tube and all the connecting wires are embedded in plaster-of-Paris.

Now under normal conditions the mercury in the tube A expands and contracts with varying temperatures. These varying temperatures may be due to summer and winter conditions, to artificial heating or lighting or any such-like cause. When the expansion due to rises of temperature from these causes takes place, the mercury in the tube A is relieved of the pressure upon it by flowing through the fine tube B into the chamber C, the reason for this preference being that mercury does not readily flow into an empty tube of small bore, and so long as the carrying capacity of the tube B is not exceeded, the mercury will flow into the chamber C, through B, rather than travel up the empty contact-pipe. It is possible to regulate the flow through the tube B by making the tube more or less fine, and the severest normal conditions can therefore be satisfied.

If, however, the expansion of the mercury in

Ask for Pamphlet Y 2.

A be so rapid that it cannot pass through B, it is then forced up the contact-tube, comes in contact with the platinum wires and gives the necessary alarm. A fall of temperature in the mercury does not cause a shrinkage below D, but the mercury descends in C. The margin between danger and safety is, therefore, the gap between the constant level of the mercury at the point marked D and the contact-wire E; and, whatever normal conditions prevail, the margin is not altered, for the mercury only enters the contact-tube under the abnormal pressure.

If a smouldering fire starts and continues so slowly to spread that only a normal rate of increase of temperature is caused the flow of mercury through the capillary tube B continues until an abnormal degree of temperature is reached; at this point the chamber C is found to be completely filled with mercury, and there being now no other means of relieving the pressure in the bulb A the mercury perforce enters the contact-tube and immediately bridges the contacts. It may be here remarked that the margin between the contact D and the contact E need only represent a fraction of a degree. In this lies the secret of the instantaneous action of the detector when an abnormal flame appears.

The compensating tube described above absolutely prevents, it is claimed, the possibility of false alarms. Where exceptional conditions are met with, such as in a foundry, a bakehouse, or a drying-stove, a detector which will compensate much more rapidly than the ordinary device is fixed, thus leaving a large margin of safety against false alarms. To quote further:—

The act of removing the outer casing causes a special contact to be made and a distinctive call to be at once given, so that any interference with the instrument is impossible. The mercury being sealed in a vacuum, should the tube be accidentally or intentionally broken, the mercury will be at once forced into the contact-tube and connect the wires D, E and F simultaneously, by which means a distinctive call will also be given. An additional advantage of the mercury being in a vacuum is that it cannot deteriorate, and the contact is therefore always perfect.

By the ingenious system of wiring the whole of the circuits may be tested night and morning by simply pressing a button at the indicator-board; and furthermore, should

a wire be accidentally cut or broken, and should a fire break out when such a fault has occurred, the alarm would still be given. Of course, the battery must be kept in order or the instrument will become inert.

We had the opportunity some little time ago of witnessing the effect of lighting a newspaper in one corner of a room where one of these detectors was installed, and were struck by the rapid way in which the alarm was given, the time being only a few seconds. We also understand that not long ago a demonstration was given in a room about 45 feet square by 45 feet high. In this case the lighting of a newspaper in the room was signalled in 15 seconds. In a hall 150 feet long, and 70 feet wide by 80 feet high, at the Glasgow University, three detectors were installed and a newspaper lighted at one end of the room. A call was in this case given in 20 seconds, all three detectors coming into action.

Although the system has not been long before the public, and only recently been put upon the market, it has already detected outbreaks of fire—one at Harrow and another in the engineers' quarters at the Houses of Parliament.

VICTORIA FALLS BRIDGE.

At the ordinary meeting of the Institution of Civil Engineers on Tuesday, March 19, Sir Alexander Kennedy, LL.D., F.R.S., president, in the chair, the paper read was "The Victoria Falls Bridge," by G. A. Hobson, M.Inst.C.E. The following is an abstract of the paper:—

The Victoria Falls of the river Zambesi are situated on the boundary which divides the administrative provinces of North-Western and Southern Rhodesia in the territory governed by the Chartered Company of British South Africa. The railway reached the bank of the river in May 1904, the distance from Cape Town being 1,641 miles and from Beira, on the east coast, 950 miles. The choice of the site for the bridge was due in the first instance to the late Mr. Cecil Rhodes, and was finally governed by the natural formation of the walls of the chasm, advantage being taken of the minimum distance to be spanned, combined with the soundest foothold obtainable. The position fixed upon is about 700 yards below the cataract.

The rock being very hard, the bridge was designed to fit the profile of the gorge with as little expenditure in excavation as possible. Several types of bridges were considered, but the nature of the situation and the purpose of the work made it obvious that a two-hinged spandrel-braced arch was the one which most completely answered all the requirements of the case. These may be summarised as handsome appearance, rigidity, economy, erection (cantilever-wise) without scaffolding.

The author briefly discusses the merits of three-hinged and braced-rib arches.

The bridge was designed to carry two lines of way of the usual South African gauge, 3 feet 6 inches. The existing line from Cape Town to the bridge (with unimportant exceptions) is a single track, but a width sufficient for a double line was necessary across the bridge in order to provide sufficient lateral stability.

In addition to the dead load the forces which the bridge is calculated to sustain are:—(1) A train on each line of way, consisting of two engines followed by heavy trucks, the weight of the whole train averaging 1.4 ton per lineal foot; (2) Temperature stresses caused by a 60 degs. Fahr. variation above or below the mean; (3) Wind-stresses due to a wind-pressure of 30 lbs. per square foot on the train and bridge, or 45 lbs. per square foot on the bridge alone. The pressure is calculated on the entire area of both arches, and stresses due to unequal distribution of such pressure are allowed for.

The bridge consists of three spans. The end span on the left bank of the river is 62 feet 6 inches and the other 37 feet 6 inches. These spans are composed of braced girders of ordinary type, with horizontal upper and lower chords 12 feet 6 inches deep and divided into square panels. The girders are fixed 20 feet apart. Connected with the end posts of the central span, they unite it with each bank of the river in a direct and simple manner. The deck is horizontal, and is laid on the top chords throughout.

The central span is 500 feet between centres of bearings, with a rise of 90 feet. The curvature of the arched rib is parabolic. The panels, twenty in number, are 25 feet in length. The depth of the girder at the crown is 15 feet, and at the abutment 105 feet. Each main girder stands in a plane at an inclination of 1 in 8 from the perpendicular.

The width between the centres of the girders is 27 feet 6 inches at the top and 53 feet 9 inches at the springing-level, and between the parapets 30 feet.

To facilitate erection and secure accuracy in alignment, a turned steel pin was inserted at the point of intersection of each vertical and diagonal member with the top chord and arched rib. The pin was designed to be of the least possible weight; as it was not intended to carry an accumulated stress, but only that due to the weight of a single panel, with the addition of a portion of the erecting plant, its weight did not exceed 30 lbs. Time in erection was thus saved and—once the pin was in its place—confidence in the accuracy of the work so far done was at once established. Reinforcement of the pin by rivets or service-bolts was a matter that could be attended to when all the members constituting one panel were in place, and it was not necessary to wait for the insertion of all the rivets in one particular panel before proceeding with the work of erecting the next.

At the intersection of the end post with the top boom and the first diagonal tie, a large steel pin is inserted through all the plates which compose these members. The pin is 7 inches in diameter and 7 feet long, its outer ends being held by means of short links attached to the top-booms. To this pin were attached the anchorage cables during the erection of the bridge. The entire bridge, with the exception of the main bearings, weighs approximately 1,500 tons.

The author describes fully the design and functions of the hinged bearings. The hinge pin is 12 inches in diameter by 5 feet 10 inches in length; it is made from a solid steel forging accurately turned all over, and a bolt-hole is drilled through the axis. Regarded in front elevation, the whole bearings, the pins especially, appear to be of very small dimensions compared with the superstructure they carry. But they are of solid construction and made of the strongest and toughest materials practicable. The pin itself is subjected to no greater pressure than $2\frac{1}{2}$ tons per square inch.

It is essential, in order that the arch may fall and rise and the top chord expand and contract with perfect freedom through great variations of temperature, that the hinges be set square to the axis of the bridge. If the pin had no other function to perform but that of supporting the load, it might

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORCKER, Ltd.,

London Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent.
where the "Drawwell" can be seen in action.

be set at right angles to the axis of the arch rib, but were this done, the pin and its fellow in the opposite bearing would not then lie, as they must, in the same straight line, like the hinges of a box-lid.

Scarcely inferior to the bearings in importance is the question of the joining of the two arms of the bridge at the centre. Each half of the arch was designed to meet the other with a butt-joint in the arch rib, and when in course of erection the two half-arches met at this joint their temporary character of cantilevers ceased to be and the structure was transformed for the moment into a three-hinged arch, the top chord having a clearance or gap left in it of several inches. In order to secure the proper distribution of stress in all members due to the complete structure, it was necessary to impart the stress artificially.

The engineering interest which attaches to the execution of this work is due in a large measure to the remoteness of the site. At the outset it was realised by the engineers that there were many possible risks which would be shunned alike by the British contractor and his workmen, and on the engineers' advice, as far as it was possible to do so, the unknown, doubtful and incalculable factors were eliminated from the task which contractors were to be invited to undertake. Throughout the preparation of the design the question of erection was considered of primary importance and every detail was devised to simplify the procedure. In designing the details, consideration had also to be given to the available means of transport by sea and rail, and particularly to the fact that the parts for one half of the bridge would have to be conveyed across the great chasm by means of some temporary expedient. The means adopted are described by the author.

The bridge was constructed in accordance with the designs and specifications of the author's firm, Sir Douglas Fox & Partners, and Sir Charles Metcalfe, Bart.

The contractors were the Cleveland Bridge and Engineering Company, Darlington.

MESSRS. PATMAN & FOTHERINGHAM, LTD., of 100 and 102 Theobald's Road, London, have obtained the contract for the alterations and renovations to be carried out at the Palace Theatre in Shaftesbury Avenue. Mr. J. Emblin-Walker is the architect.

LABOUR ACCIDENTS IN FRANCE.

A FRENCH workman injured in the course of his employment has by law the right to choose his own doctor and dispensary. The General Confederation of Labour, as the central organisation of the trade unions is called, has determined to take advantage of this privilege and to supply medical assistance to injured workmen. This new departure is being taken at the Labour Exchange to succour all members and non-members who may meet with accidents while at work. The necessary rooms have been fitted up with all the most up-to-date scientific appliances, including the X-rays, and medical men and surgeons, specialists in their departments for the treatment of accidents, will be available at almost all hours for consultation, and in case of necessity certificates are gratuitously given.

By the French law on accidents the injured operative has—1. The right to choose his doctor. 2. The employer is bound to pay the fees, and in no case can the employer impose his medical man on the operative. 3. The doctor of the insurance company has no special right to attend to the injured or to give a certificate of the accident, which latter may be given by the doctor selected by the injured person. 4. No particular hospital or dispensary can be imposed on the operative. 5. The document given to a workman at the time of his injury, permitting him to go to the company's doctor, had no special value, and could be destroyed or lost without prejudicing the worker's rights. 6. The domicile of the injured operative was inviolable. No doctor, with the exception of the one authorised by the magistrate, can enter without his consent.

THE list of claims in respect of damage caused by subsidence in the Northwich salt compensation area has been issued. Ninety-five claimants seek to recover 3,340*l.*, the highest individual claim being for 600*l.* Under the special Act of Parliament which provides for the levying of a tax upon all the brine pumped a maximum charge of 3*d.* per 1,000 gallons may be made. Last year the brine pumped was 486 million gallons, and the rate levied was 1½*d.*, the lowest on record.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITION OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. Gill, town clerk, Town Hall, Birkenhead.

THE WELL-KNOWN FRIEZE

ENTITLED

"THE CORN FIELD."

Opinions of the Press.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

TRADE NOTES.

We have pleasure in announcing that Messrs. Henderson & Glass, steel and iron merchants, of Vulcan Street, Liverpool, have admitted into partnership Mr. William Duncan Henderson and Mr. Robert Glass, the sons of the present partners.

THE Guild of Handicraft, Ltd., have been entrusted by Mr. E. W. Allfrey, architect, Oxford, with the production and fixing of a handsome oak screen and stalls at St. Helens Church, Abingdon, and also some special carving work, including a 2 feet 6 inches figure of Madonna and Child and a similar one of St. Michael for oak reredos in Urswick parish church, under the instructions of Messrs. Settle & Brundrit, architects, Ulverston.

A LARGE turret clock has just been completed, showing time on four dials 9 feet 6 inches diameter, with one large hour bell, for Halifax, Nova Scotia, Canada. It is fitted with all the latest improvements, including Lord Grimthorpe's gravity escapement and compensating pendulum, &c., and is made by Messrs. W. F. Evans & Sons, Soho Clock Factory, Handsworth, Birmingham. The same firm have also just completed four public clocks with two dials to each and fixed them at Newcastle-on-Tyne, Sunderland, Lincoln and Wolverhampton, and also a turret striking clock for Evesham and two others fitted up in London.

SCAFFOLDING has had to be erected at the south tower of Exeter Cathedral for the purpose of ascertaining the cause of a crack discovered some time ago which extends from near the ground to the battlements. Trenches have been sunk, but no change in the foundations has been revealed.

NEW CATALOGUE.

THE "Harrogate" fireplace, manufactured by Messrs. Hopkins & Co., has several varieties, and illustrations of them are given on an adequate scale. Progress in fireplaces might be said to be marked by a descent towards the hearth, which, unlike most improvements, is a return to primitive ways. In the "Harrogate" the coals are separated from the hearth by the space needed for a shallow ash-tray. A feature which should render many people pleased with this fireplace is the absence of bars, with their inevitable need of black-lead, which in the old-fashioned types make serious demands on a servant's time at the most precious hours of the morning. Furthermore, no flue-brush is required. A house equipped with Harrogate fireplaces should know no servant problem. Messrs. Hopkins & Co. are ready to carry out at their Tunstall works any design submitted to them, and they will send the plans for fixing. The tiles are a noteworthy factor in their works, where the firm produce them glazed, printed and coloured, enamelled, embossed, majolica, barbotine, hand-painted, decorated and enamelled. There is much difference in effect between the "Windsor" fireplace, with its enamelled-slatted tile surround, with its graceful Adams decoration on an ivory ground, and the "Empress" fireplace, with a surround of enamelled briquette antique tile. There is a hood. The manufacturers can claim to have produced not only a cheap but a simple fireplace, which can be readily fixed by an ordinary bricklayer, and one which is cleanly owing to the complete combustion of the fuel, and implies only a slight amount of labour on servants. The tiles, curb, mantelpiece used by the firm are excellent in form and colour, and help to recommend the "Harrogate" for adoption wherever good taste prevails.

LORD AVEBURY will preside at the annual soirée of the Selborne Society, to be held, by permission of the First Commissioner of Works, in the Civil Service rooms at Burlington House on April 26, when illustrated addresses will be given on subjects of special interest.

The Building Trades Exhibition, Olympia.

THE RIGHT HON. THE LORD MAYOR, SIR WILLIAM TRELOAR.

"WESTWARD the course of Empire makes its way" was the declaration of Bishop Berkeley to explain his abandoning of preferments in England in order to teach missionaries for the Indians in Bermuda. The success of the United States, which did not exist as an independent Republic in his time, suggests he was right. If we may presume to follow so illustrious an example in respect of a more material subject, we should say that of late years the tendency of exhibitions in London is also towards the west. Mr. H. Greville Montgomery was therefore wise in opening his Building Exhibition of 1907 in "Olympia" at Kensington, although his enterprise made it necessary to break with old associations. We are confident that the results for himself and his supporters will justify his action. Considered simply as a show the exhibition in its new quarters is more effective than any of those held in Islington. Never before were such elaborate structures set up as specimens. For some of them are of a solidity which made licenses for their erection from the County Council essential. The galleries are more accessible, and in other ways exhibitors and visitors will find they have gained by the removal. We may therefore assume that on Saturday, after the opening by Sir William Treloar, the interest of the exhibition will be quickly recognised.

Anyone who is acquainted with exhibitions during their preparatory stages will acknowledge the difficulty of being able to do justice to the contents. Every hour confusion seems to become worse confounded by new additions. Some exhibitors also make it a rule to keep back their specialties to the latest moment which the arrangements allow. The notices we give this week will therefore have to be taken as subject to correction when more favourable opportunities arise for a closer examination.

The collection of *Thos. Lawrence & Sons*, of Bracknell, is always interesting for the colour and texture of the bricks. The makers have been desirous to display the applicability

COMPETITION DESIGN FOR CHALKWELL HALL SCHOOLS,
WESTCLIFF-ON-SEA.

HEAD-QUARTERS FOR THE ESSEX COUNTY POLICE.

of their brick for decorative work. This year they have been well inspired, for they show gauged and carved pilasters and arches executed by the students of the Tottenham, Wimbledon and Battersea Polytechnics. It is commonly understood that work seen in exhibitions is produced under the most favourable conditions, but in this case we find that even students can work out excellent ornament with such materials. To meet modern demands Messrs. Lawrence have been engaged in colour experiments, and are able to present satisfactory examples in different shades. Another desirable product is their 4-inch facing bricks, which are darker in colour than those used in the Westminster Cathedral.

Messrs. G. Tucker & Son, Ltd., have a varied collection of bricks and tiles. An interesting addition to modern examples will be found in the collection of Roman tiles made from the same clay, and which continue, in spite of their antiquity, without any signs of decay.

Portland cement was never used in such large quantities as at the present time and never was care in selection so necessary. The Saxon Portland Cement Co., Ltd., reveal the transformation of the material as seen in its various tages from chalk marl, as it leaves the quarry, to the renowned Saxon cement. We can see the efforts which are made by grinding, burning, crushing to eliminate all weakness, until it becomes equal to a minimum tensile strain of 600 lbs. per square inch. Every ton which leaves the works is guaranteed of that strength, as well as equal to meeting all the conditions of the British Standard Commission.

Messrs. J. Osman & Co. exhibit a model of their "new perfect" continuous kiln, as well as photographs of other kilns they have erected at home and abroad. It is claimed that they are capable of burning every kind of clay product. Several of their kilns have been set up at Durban in South Africa, and they have others in Mexico and China. In ten years they have built over 140 kilns.

The Fireproof Company, Ltd., again rely on their dovetail corrugated steel sheeting, which is well adapted for fireproof floors, ceilings, partitions, casings to girders and stanchions, proscenium fronts and much else. Its adaptability is remarkable. It will serve for centring in difficult positions; with neat cement it can become a damp-course, and with "camjud" slabs varying from 2 inches to 3 inches in thickness, will form complete partitions, reinforced concrete pipes, &c. With such a combination it would be hard to discover the kind of building in which it cannot be turned to account.

Vulcanite, Ltd., display some of the applications of asphalt. They have varieties for damp-courses, sloping roofs and flat roofs. An object that is sure to attract attention is a roof-tank, which shows how the material will serve that purpose, and likewise how patent vulcanite roofing is impervious to moisture.

The stand of Julius Hülsen & Co. will appeal to chemists from its practical applications of that science. They manufacture hydrate of barium for softening water for boilers, the deposit becoming a soft mud, which can be easily blown off or cleaned out. By this anti-incrustator boilers are preserved and the risk of accidents is minimised. Another of their preparations is precipitated carbonate of barytes for preventing scum on bricks, terra-cotta, &c. Practical brickmakers have testified to its value. They also show leadless glazes, pure silica ware for decorative purposes, &c.

A building exhibition would be incomplete if William Oliver & Sons, Ltd., were not represented. In their collection of timber we have nature unaffected, and where so much has to be artificial their immense longitudinal sections of noble trees refresh the eye. They will present this year hardwoods, dry and fit for immediate use, in wainscot oak, mahogany, walnut, teak, American quartered and plain oak, whitewood, pitch pine, kauri pine, yellow pine, &c., veneers, teak and wainscot oak floorings.

THE KAHN TRUSSED BAR, ALTERNATING TYPE

TRUSSED CONCRETE STEEL CO.,
CAXTON HOUSE, WESTMINSTER.

The Silicate Paint Company have hitherto been content to suggest the character of their invaluable "Duresco" for plain walls and for decoration. This year they have resolved to display its manifold uses, for they have had constructed a full-sized bungalow, in which Duresco will be used throughout, and which will become one of the most impressive objects in the exhibition. On looking at the structure it can be understood why 30 tons and upwards of Duresco was used in the new War Office.

Wood is so largely used, its preservatives have now increased interest. "Solignum," of Mayor & Co., Ltd., is a protection against vegetable or other enemies such as dry rot and white ants. Both in this country and in Africa, Australia and Japan it has been found efficacious, and as it is made in two colours, brown and green, it has also decorative value.

The Globe Tank and Hurdle Company will contribute their patent rotary screens, flat screens, sand-washing machines, lock nuts, railings and gates.

Messrs. Cakebread, Robey & Co.'s stand is likely to suggest to strangers the variety of goods required of metropolitan builders' merchants. In their collection will be found several types of ranges, stoves, boilers, sanitary goods, patent drain joints and drain machine appliances, smoke-test machines and drain rods, which are in demand in all parts of the world. A special feature is a cast-iron verandah with glass roof for villa residences, for which there is likely to be a demand.

Messrs. Wilmer & Sons will be represented by several of their patent grates and ranges, by porcelain baths and lavatories, chimneypieces in wood, marble and iron and tiles. They make a specialty of grates, and the patent "Bond's" fire and "Sine Qua Non" range will be shown in action. The former occupies small space, but is effective and is produced in several forms.

The Nautilus Fire and Heating Co. will exhibit grates which have been designed by architects, as well as dog grates and mantelpieces. The St. Ivel and Nautilus cooking ranges, which have self-contained flues, will be shown, together with two new types of baths.

The Coatstone Decoration Company will display a wooden structure which from being coated with their "liquid stone" is suggestive of masonry. The company have also a

peculiar rough-cast which is cheaper than what commonly goes under that title. They will also show "Sandisco," which is a washable distemper, besides a stone preservative and a stone backing solution which prevents the penetration of acids and the discoloration of new work.

The announcements of *The Brilliant Sign Company* are too well known to need much description, for they correspond with the title conferred on them. A factory has been opened by the company at Antwerp, and another at Buenos Ayres is under consideration. They have secured an order for letters which will cover 500,000 inches. A new process for background work has been introduced, and from possessing steel dies the company can use stouter copper than is possible when only wood dies are available.

Acetylene gas generators and fittings especially designed for acetylene lighting will be seen at the stand of *Mr. Thomas Potterton*. As he is also a heating engineer, there will be specimens of various kitcheners, heating apparatus, boilers and ranges. The "Victor" gas boilers are adapted for use in flats, and have been adopted by various gas companies.

The firm *James Austin & Sons, Ltd.*, are in their second century, and the list of buildings in which they have co-operated by their ropes and cords, if it could be prepared, would be an interesting document. Among their exhibits this year will be the Eclipse picture line, the Goliath sash-line, the Venetian blind-line and endless cords.

The "Clipper" Belt Hook Company have several useful specialties, including an improved wall-tie, a clip for attaching electrical tubes to girders, a clamp for extending scaffolding planks, a safety belt-shift, a gate hanger, &c.

Hall's Distemper was so skilfully brought to notice in former exhibitions it is difficult to surpass those efforts. The new stand takes the form of a picturesque cottage which visitors are likely to covet. Distemper prepared for exterior work—"Sisco," "Aperfectol," "Orientolac"—and distemper adapted for interior work are employed. There is also a set of screens which prove the decorative value of other varieties. Considered as a comprehensive exposition of an important business the stand will be admired by all business men, and everything in it will sustain examination.

GREAT BUILDING TRADES EXHIBITION

APRIL 6th to 20th, 1907

OLYMPIA

Organisers:

H. G. MONTGOMERY, M.P.

HUGH C. MONTGOMERY.

Offices:

43 ESSEX STREET, STRAND, W.C.

Over 300 Exhibitors,
occupying over 150,000
square feet of space.

Messrs. Phillips & Son are exhibiting their "Channel Bolt" and other safes, which are fireproof and burglar-proof. Strength is derived from a special rolled section,

which recalls the Classic fret and which frames the door, preventing air, fire or water from entering. Inexpensive party-wall doors and fourfold doors for large stores are so among the contents of the stand.

Subjects which are remotely political are excluded from the purview of *The Architect*, or it would be easy to draw attention to the peculiar position of Messrs. Walter Carson & Sons. They are one of the few firms who carry on business in Ireland as well as in England, and the testimonials to their paints, oils, stains and varnishes include names of Irish as well as English customers. Yet for years they have remained unaffected by any disturbances which may take place around them. If more firms were disposed to imitate Messrs. Carson the Irish difficulty would be diminished. Everything connected with painting, including brushes, putty, enamels and varnishes, is produced by them, and

whatever bears their name is of a high character. Their plastine is adapted for glass roofs of every description, and is a substitute for putty which is unaffected by the atmosphere for a long period. Muraline is in many colours and is a washable water paint. Vinolite is a paint for conservatories and greenhouses. The works of the firm at Battersea are extensive, and from their long experience Messrs. Carson are able to combine quality with economy.

The inventions and rights of Mr. P. B. Jagger have been acquired by the *Improved Construction Company*; they are, therefore, able to employ concrete under new conditions for paving slabs, floor tiles, building blocks, roofing tiles, floor beams, girder covering, stanchion covering, sewer pipes, railway sleepers, steps, sills, lintels, architraves, cornices, friezes, dadoes, columns, pilasters, bases and capitals, &c. The company claim as proof of facility in production that they can turn out 72 superficial feet of paving slabs of any design, or twelve 32 inches by 9 inches by 6 inches interlocking building blocks of any design or colour, in less than fifteen minutes, and all other materials in like proportion. They have in stock standard designs for ornamental work, but they promise to follow exactly any details furnished by architects. The works of the company are at Strood for the London market, but works can be erected in any part of the country to supply local demand. One advantage which builders will appreciate is that licenses for using the process can be granted on advantageous terms to those taking them, and the works at Strood can be used in order to verify the statements about the machinery and processes.

The quality of the artificial stone manufactured by *The British Building Stone Co., Ltd.*, may be judged from the fact that it competes with nature in lithographic stones. They are subjected to such a variety of strains that a material which will stand would appear suited for work which at first sight might appear more exhausting. When we find that, according to a report by Messrs. Kirkaldy & Son, 3-inch cubes of the company's artificial stone required about 12,000 lbs. per square inch for crushing, it is evident that the material is equal to all requirements. Chemically it has been ascertained that the artificial stones compare most favourably with natural stones, and are likely to prove extremely valuable for building purposes. So far the experience in actual buildings has con-

firmed what science had anticipated. The new stones can be produced from a thickness of only $\frac{3}{4}$ of an inch up to any height that is desirable in blocks. They can be moulded to any design and turned out dressed and carved complete. The stone shown has been manufactured with a small experimental plant, but it is sufficient to reveal the commercial and constructive possibilities of the patents and process of Mr. T. M. Thom.

The chief articles exhibited by *Messrs. C. Chancellor & Co.* are their well-known velure Japan paint and stripso paint remover. Velure is claimed to be more elastic than any other paint. That it resists exposure to hot sunshine without cracking or chipping off, and stands wear and tear, is proved by the large number of testimonials from all parts of the world, including the Soudan desert region about Wadi Halfa, and such countries as Brazil and Australia. H.M.S. *Ivy*, stationed off the Guinea Coast, just under the equator, has been painted for many years with velure. A number of wood panels demonstrate the beautiful surface and colours. A number of this firm's specialties, including a damp preventive; fumood, a preparation for fuming wood, a swimming-bath paint, &c., are also shown.

The *Kinnear Patent Steel Rolling Shutters* have triumphantly withstood many fiery trials, including tests by the British Fire Prevention Committee. Messrs. Arthur L. Gibson & Co. have such reason to be proud of the results of the latter, they have transported the set of two shutter doors which were fitted on either side of a 14-inch wall to represent a party-wall door. The four-hour test was of unusual severity, as it was interrupted owing to damage to gas producer, and water was applied to cool the shutters. At the conclusion of this double test it was found that the inner shutter had been little damaged by the great heat while the outer was almost as good as new. Reports of the tests should be perused by district surveyors who may interpret too literally the clauses of the London Building Acts as to party walls. In America these shutters are employed as fireproof curtains for theatres. The stand shows a larger rolling shutter suitable for wider and higher openings. A B. and S. patent folding gate encloses another of the four sides, while a small shutter for a window opening encloses the fourth. The floor of the stand is laid with patent interlocking rubber tiling.

VARIETIES.

PLANS have been prepared by Messrs. J. D. Swanston & Syme, of Kirkcaldy, for a hippodrome in Lindsay Street, Dundee. The resident architect will be Mr. Leslie Ower.

THE Macclesfield highway committee have passed the plans of a memorial hall and Liberal club, to be erected in Exchange Street, at a cost of 6,500*l*.

THE Middleton Evans estates, which include the greater part of Llandrindod Wells, the Pump House Hotel, with its pump-room and famous springs, and the Llanerch Hotel, are to be sold by auction by Messrs. Knight, Frank & Rutley.

SIR JAMES RECKITT has purchased the Holderness House estate, in East Hull, belonging to the Jalland family, with the intention of constructing a garden village. The site is about a mile long and a quarter of a mile wide, and it is estimated would provide accommodation for 10,000 inhabitants under garden city regulations.

MESSRS. R. M. C. CRAWFORD & DAVID FRAME, trading as Crawford & Frame, Talbot Place, have served on the town clerk of Dublin a writ claiming an injunction to restrain the Corporation from entering into any contract in connection with the Clontarf main drainage other than that entered into with Messrs. Crawford & Frame, and to compel specific performance of that contract. They have also caused a writ to be served on Mr. Vance, a member of the Town Council, claiming damages for alleged libel and slander.

A CURIOUS astronomical clock in Ottery St. Mary Church probably constructed by monks, is being set right (after being in disuse for a century) by an expert in horology. On the face, or dial, there are no hands, but in lieu thereof are figures representing the sun, moon and a star, indicating respectively the hour, the day of the month and the phases of the moon. The clock is of a pattern similar to one in the transept of Exeter Cathedral.

THE Acorn Hotel, in Temple Street, Birmingham, has been reopened after reconstruction and enlargement on an extensive scale. It has now a hundred or more good airy bedrooms, and is unique in the quadrangular arrangement of its planning to meet the contingency of fire, for a continuous passage runs all round the hotel to give the occupant

any room easy access to numerous staircases and emergency exits. The contractor was Mr. Thos. Rowland, and Messrs. Wood & Kendrick, architects.

EDINBURGH NEW ART SCHOOL.

The site of the new art school is the north part of the Leith Market, and the building, which is in the form of a parallelogram measuring 370 feet by 126 feet, is nearly parallel with the north boundary wall, and about 22 feet from it. There will be access from Lauriston Street, says the *Scotsman*, and also from Lady Lawson Street by the steeply inclined way. There is a sharp slope on the ground from south to north, and as the present surface was found to have been levelled up in 1843, it was thought advisable to put down bores to find out at what depth suitable foundations could be got. These bores disclosed the necessity of going much deeper than is usually necessary, and advantage has been taken of this necessary underpinning to form a basement under the northern part of the school. There are two internal courts, separated by the centre block, containing the main staircase, &c., and all the buildings surrounding these courts are two storeys high, excepting in the case of the west wing, which is one storey high. The main entrance is in the centre of the south front. The outer hall enters an inner hall 31 feet by 21 feet, from which the corridors of the south wing branch right and left, and facing the entrance are the corridors to the north wing and the main staircase to the upper and basement floors. The outer hall is flanked on the left by the porter's room, in which there is cloak-room accommodation for visitors to the school, and on the right by the office. The office communicates with the directors' room, and attached to the office is a shop for the sale of paper and other artists' materials. The corridors, which are all 9 feet 6 inches wide, run straight from end to end of the building—a satisfactory arrangement for purposes of control. The main staircase, which is of stone, has steps 9 feet 6 inches wide, and, being in the centre of the building, is as conveniently placed as possible for intercommunication. The east court is covered over with a roof having a large amount of glass, and forms a sculpture gallery and museum,

measuring 70 feet by 38 feet. It is separated from the corridors flanking it by arched openings on the ground-floor and square-headed openings of similar breadth on the upper floor, and it is intended to place the beautiful casts of the Elgin marbles, now in the Royal Institution, over the arches, where they will be seen to great advantage. This sculpture hall will be seen from the entrance-hall and from the corridors on both floors of the east section of the building, so that students will be in daily touch with statuary and other works of art.

From the corridor of the south-east wing are entered the directors' room, council-room and a small museum for special art specimens, and at the end of the corridor is a room 60 feet by 36 feet 6 inches for instructing house painters in the principles and practice of decoration. A conservatory for plants opens off it. The rooms on the south-west wing are a lecture-room for anatomy, 28 feet by 27 feet and a room for elementary modelling 88 feet by 25 feet. The modelling-room has a door to a passage near the west extremity of the building, by which clay will be brought into the clayhouse in the west wing. Clay will be taken to the modelling-room by this door, thus preventing, as far as possible, the use of the corridors for this purpose. At the end of this corridor there is a stair for access to the staff apartments on the floor above. The west wing of the north part of the building is set apart for sculpture, and there are life classrooms for women and men, 30 feet by 30 feet and 36 feet by 30 feet respectively, and a modelling-room 55 feet by 30 feet. A studio for the professor is placed between the life classes, with apartments for the models. In the centre of the north wing there is a room, measuring 67 feet by 32 feet, for elementary drawing, and in the east wing a room 55 feet by 30 feet for drawing from the antique. The rest of the north wing is set apart for still-life painting, the room measuring 80 feet by 30 feet, so arranged that it can be divided by curtains. In the west wing there is a room 45 feet by 32 feet for teaching the principles of design, and also a room for the professor. The larger room has a door to the conservatory at the south-east corner of the building, in which plants used for purposes of study can be kept. Returning to the west wing there is provided a workshop, painting and carving-room, room for casting and a clay-room. Part of the east court is covered

in with a glass roof, forming a pavilion 40 feet by 38 feet for animal painting. Animals can be brought into the pavilion by the 10-feet wide passage at the end of the elementary modelling-room.

Over the main entrance there is, on the first floor, a hall 60 feet by 30 feet, in which ceremonial functions, exhibitions of students' work, &c., can be held. Entering off the south-east corridor are a room for process etching, a room for elementary architecture 72 feet by 25 feet, the professors' room, and a lecture-room 28 feet by 25 feet, and in the east wing, entered from the same corridor, a classroom 60 feet by 30 feet for advanced architecture. In the south-west wing are the library, 43 feet by 25 feet, and a room for students' proofs, 31 feet by 25 feet. Between them is the librarian's room, in whose charge the students' proofs will be placed. The remaining rooms are set apart as common rooms for the professors and assistant teachers. The whole of the north wing is set apart for painting. In the centre there is a large room for composition, and in the east wing three life classrooms, each 41 feet by 30 feet, one of which is for women. Each room has suitable apartments for models attached to it. The professors' studio is beside the large central room. The west wing is set apart for studios for advanced students. There are six, each 21 feet by 17 feet, and at the end of the corridor is a large studio, 30 feet by 30 feet, for the director. There are lavatories in each of the wings, and on the basement floor a large cloak-room, 30 feet by 30 feet; common rooms for men and women students, 26 feet by 17 feet, with lavatories attached to them, and general lavatories. The remaining rooms in the basement will doubtless be found useful for teaching book-binding, carving, &c.

Looking to the size of the building and the sum available for its erection, the utmost economy had to be observed in its design. As the south front can only be seen when inside the cattle market, it has been treated in the simplest manner possible, with plain piers separating the windows, which are surrounded by simple mouldings, the details being of somewhat French type. The centre of the south front is slightly accentuated with pilasters and a pediment over the three central windows. As the effect of the building from Johnston Terrace and the Castle Esplanade is probably of

more importance than its appearance from any other standpoint, the roofs at the angles of the building and those of the centre blocks have been carried up considerably above the general level, so that from a distance the building will have the orderly appearance appropriate to a public edifice. From motives of economy, and looking to the difficulty of getting any satisfactory durable white or grey stone, it is proposed that the hewn work shall be of red stone and the rest of the wall surfaces of what is known as common rubble from Hailes Quarry. The interior is practically devoid of ornament, reliance being placed on the proportion and breadth of the corridors for architectural effect. The sculpture hall and corridors surrounding it will, it is hoped, even in the absence of ornament, prove a satisfactory centre for such an important building. The heating is proposed to be by hot water, and the ventilation by extract fans placed in the courts, with ducts from the various apartments. The heating chamber will be in Lady Lawson Street, so that coal may be taken in at street level. The architect (who took up the work on very short notice from the Town Council, and has so far carried it through with the utmost despatch) is Mr. J. M. Dick Peddie, Albyn Place.

THE DRY EARTH SYSTEM.

MOULÉ'S Patent Earth Closet Company, Ltd., whose name is associated with the earliest introduction of the dry earth system to public attention, are keeping abreast of the prevailing activity in matters hygienic. They have recently patented an improvement upon the old type of earth distributing machinery, which appears to be a distinct advance in efficiency, and the novelty is applied to their old and to some newly introduced patterns. Those who prefer the old style of cased-up closets and those who favour the pedestal form will find in the company's catalogue illustrations of both sorts in variety, and all of them are equal to any good modern water-closet in appearance and in the quality of the fittings.

The system has outlived the discussion stage, and now very successfully competes with the several schemes put forward with more or less pretension to wrestle with the troublesome rural sanitation problem. The earth system

prima facie an obviously natural method, for the impulse to bury putrescible matter in earth appears to be instinctive in all animals. Besides, fine dry earth has a power to deal with such matter that is far more potent than is generally known.

Another recommendation the Moule's system has to offer is the lowness of cost and the readiness with which it may be installed. The village carpenter supplies all the skilled labour required, for here are no cisterns, pipes, valves, drains or cesspits, and incidentally to this last evil there is no fear of befouled wells.

The upkeep of a Moule's closet appears to be proportionate—the little attention required to provide and maintain supply of dry earth for furnishing the hopper and the removal of the used earth. Upon these matters the company are qualified to give practical advice from their lengthy experience of close upon fifty years of such work.

Reduced to a simple routine these items of attention become but an incident in the week-end work of a country house or cottage, and the possessor of the earth-closet has this additional compensation for his trouble—that thereby he is absolved from the impost of a sewer rate and part of a water rate, burdens which rest heavily in the neighbourhood of towns.

Moule's Company publish papers which explain how their closets are arranged on upper floors, and how closets inside the house—upstairs or down—may be attended to from the outside. The Board of Education, in the Regulations for Planning and Fitting-up Public Elementary Schools, recognise the utility of earth-closets in rural districts, and the company has lithographed plans to meet this requirement. From the testimonials printed by the company we note the wide range of adaptability of these closets; commendation comes from private houses, from a college, from a sanatorium and from a reformatory, and it is stated that Government departments have purchased more than 12,000 of these appliances.

FIRE-RESISTING CONSTRUCTION.

At the fifth annual general meeting of the Insurance Society of Edinburgh Mr. F. A. Macdonald read a paper on "Standard Fire-Resisting Construction in Relation to the Present Rules of the Fire Offices Committee," in the course of which he made special reference to the various forms of fireproof construction and the methods of designing buildings so as to meet the risk of fire resulting from occupancy. A number of different systems were described, particular attention being directed to the ferro-concrete or reinforced concrete construction, a full description of which was given. Insurance offices should, the lecturer said, set up a less perfect standard of fire-resisting construction in order that that form of building might be more generally adopted for warehouses and factories. While it was possible to construct fire-resisting structures of a very high standard, it was not the specification of certain details that would insure efficiency, but rather the skill and knowledge of the general engineer. Those who undertook such duties should have some knowledge of constructional work and the resistance of materials to fire, and have ability to estimate the fire hazard which would arise from the occupancy and exposure. In conclusion, Mr. Macdonald suggested that the Fire Offices Committee might give consideration to the creation of a standing sub-committee, to whom all questions on fire-resisting construction should be referred, as he was convinced that the expense of the establishment of a central department devoted to the work would be repaid many times over in the first two or three years of its existence. A discussion followed.

SEVERAL important building schemes have taken shape in Dundee, and the prospects for masons, joiners, plumbers and the allied trades for the current year are bright. A start has been made with the new West End branch library, and in the course of a week or two workmen will begin operations for the erection of a similar institution for the north end; the new technical institute in Bell Street will be undertaken; Mr. Swanston, Kirkcaldy, has lodged plans for the new theatre to be erected in Lindsay Street.

MASTER MONUMENTAL MASONS.

THE inaugural meeting of the National Association of Master Monumental Masons and Sculptors was held at the Cannon Street Hotel on March 12 at 3 P.M. There was a large and fully representative attendance from provincial towns and the London area. Mr. W. Borrowdale, of Sunderland, the convener of the meeting, opened the proceedings with a short speech, in which he referred to the real necessity of forming such an Association on a broad basis, to assist and protect them in their trade interests in these times of complex and competitive conditions of trade. He announced and read a number of letters he had received from firms trading in various parts of the country offering to join the Association and expressing a wish for its success. The meeting then elected to the chair Mr. Bennett, sen., of Brighton, who, after thanking them for the honour, dealt with some of the evils with which the trade contended unsuccessfully as individuals; but they would be successful as a body or association in redressing those grievances and in dealing with the marble merchants' and the granite trades association, also the railway companies and their excessive rates and charges. Mr. F. T. Mossford, of Cardiff, spoke upon other similar points and the meeting was thrown open to free discussion.

Among the subjects discussed were the obnoxious cemetery rules and excessive fees, and the fact that in some districts municipal trading was done. This threatened their very existence as independent tradesmen, and was no doubt illegal. The question of being able to deal with secret commissions by their Association being allied to the Secret Commissions' Prevention League, and also the advantage of an information bureau, in which could be included and registered the names and addresses of expert reliable workmen and specialists, were considered. It was brought out that the members of the Association could collectively insure their workmen under the Employers' Liability Act at about half their individual payments. The encouragement of the apprenticeship system, and the desirability of doing as much work as possible in this country, possibly through local arrangements, was also discussed, and felt to be desirable in sustaining the practical retailer in his proper position.

It was decided that the name of the Association should be "The National Association of Master Monumental Carvers and Sculptors," that there should be no entrance fee for the first three months from that date, and that afterwards the entrance fee, should be one guinea, and a subscription of one guinea in advance per annum should be payable by members.

Mr. Borrowdale mentioned that he had had two applications for the post of secretary. After discussion, it was agreed to appoint Mr. Robert J. Ward, chartered accountant, 2 Clement's Inn, London, W.C., as paid secretary, the Association to have the use of Mr. Ward's offices for committee meetings. It was also agreed to appoint Mr. W. Borrowdale as honorary secretary with him.

ELECTRICITY AND SLATE-MINING.

At the ordinary meeting of the Institution of Civil Engineers on March 26, a paper was read on "The Application of Hydro-Electric Power to Slate-Mining," by Mr. M. Kellow.

The slate mines of Wales are situated almost without exception in the counties of Carnarvonshire and Merionethshire. The mountainous character of the country greatly facilitated mining and quarrying operations in the past, as the steep hillsides enabled the slate beds, which incline at high angles, to be worked by adit levels and horizontal galleries directly from the hill-sides, and a small amount of power only was required under these circumstances. The conditions tend to become less favourable every year, as the workings become deeper, and as also mechanical aids in the manufacture of slate tend to become more universal, the requirements, as regards power, must increase considerably.

Though steam has hitherto been chiefly used, there is an abundance of water-power in the two counties, which, if applied, would supply all the needs of the slate industry in this respect. There is little doubt that when the advantages of utilising water-power in conjunction with electric transmission and distribution are generally realised, it will be used almost to the exclusion of any other in slate-mining. The author designed and installed a hydro-electric plant which contains many features of novelty. The problems

covered a wide area, and the application of the principles involved to slate-mining generally were considered. The scheme has been carried out in the Croesor and Cwmfoel valleys in the vicinity of Snowdon, and includes all the essentials of a complete power system.

Details were supplied as to rainfall, catchment area, water-storage (partly by means of a reservoir 12 acres in extent, constructed at an elevation of 1,460 feet above the sea), and a steel pipe-line with its accessories. So far as the author is aware, there is no previous example of so high a head of water as 860 feet having been utilised in the United Kingdom. Particulars of an original design of air-vessel for use at the bottom of the pipe-line, furnished with hydraulic charging apparatus, to enable it to be filled with air at a pressure corresponding to that of the water, were given.

The author having carried out a large number of experiments on various forms of buckets, nozzles, &c., certain conclusions were arrived at, which were stated in the paper. Efficiency-curves, with different forms of bucket at various peripheral speeds with constant volume, and at constant peripheral speed with varying volume, are given.

The advantages and disadvantages involved by the use of continuous and alternating current respectively, as regards generation, transmission and distribution were compared, and a conclusion was arrived at that the three-phase alternating-current system is the one best adapted to slate-mining. Considerations affecting the choice of periodicities were discussed, and forty or fifty cycles is regarded as the most suitable. The type of generator and method of driving were considered, and conclusions stated.

The conditions under which it is desirable to generate at the distribution voltage, and those under which transformation is desirable, were described, and also the methods of driving the exciter from the alternator-shaft, and from a separate power-source respectively.

The essential qualities in mining plant are stated to be reliability, first-class mechanical construction and simplicity of operation, and as regards motors these conditions are best fulfilled by the three-phase induction type. The conditions prevailing in slate mills were described, and group-driving by moderate-sized squirrel-cage motors is favoured. The peculiar requirements of winding-up inclined planes,

W.C.

which are usual in slate-mines, the character of the traffic, &c., were dwelt upon, and the conclusion arrived at that three-phase motors are well adapted to the work. The types of motors most suitable to the driving of pumps, fans, winches, &c., were considered. The influence of various starting devices, used in connection with the motors, on the power-factor of the system, was discussed. The advantages of the three-phase system as applied to slate-mining were then summarised and the plant installed for mill-driving, winding, traction, pumping, lighting, &c., at the Croesor Slate Mine described. Efficiency curves were given relating to every part of the system separately and in combination.

MERSEY IMPROVEMENT.

THE Mersey Docks and Harbour Board have for many years past employed a powerful plant in dredging the bar of the river, Queen's Channel, and certain shoals which tend to form in other parts of the $12\frac{1}{2}$ miles of main channel lying seawards of New Brighton. By the work of the sand pump dredgers *Brancker* and *G. B. Crow* the depth of the channel has been greatly improved so as to satisfy the present requirements of shipping, and from this point of view its condition has never been better than at present.

While it is necessary that the requirements of vessels as regards depth should be fully met, it is desirable that the width and direction of the channel should also be such as to render navigation easy for the growing numbers and length of vessels frequenting the port, and the work of the dredgers has also been successfully directed to the regulation of the width and outline of the channel.

For many years past that portion of the Taylor's Bank which forms the concave side of the channel abreast of the Crosby Lightship has been gradually receding owing to its erosion by the tidal currents. This is an ordinary phenomenon noticeable at the bends of all rivers, and is due to the centrifugal force of the current acting on the concave bend and producing an erosive effect. Currently with, and in consequence of this recession of the Taylor's Bank, the Askew Spit, on the opposite or convex side of the channel, has advanced towards it.

The result of these movements is that the bend in the

Crosby Channel at this point is becoming more accentuated and, having regard to the very big ships now frequenting the port and the increase in their size which may be anticipated, requires to be controlled and improved. The best method of effecting this has been under the consideration of the Board for some time past, and after a careful study of all the surroundings of the case they have determined to adopt the proposal of their engineer-in-chief, Mr. Anthony G. Lyster, to "revet" with stone the southerly face of Taylor's Bank, so as to prevent further erosion.

Before, however, adopting this suggestion, they and their engineer thought it well that the question should be considered by a commission of the highest engineering authorities on such questions in this country. After mature consideration of the question and visiting the spot, this important commission unanimously confirmed Mr. Lyster's proposal. The Lords of the Admiralty and the Mersey Conservancy, who have been advised by Vice-Admiral Sir G. S. Nares, K.C.B., F.R.S., Acting Conservator, and Sir William Matthews, K.C.M.G., vice-president Inst.C.E., have sanctioned the project.

The work, which follows the lines successfully adopted in other rivers, consists in the deposit along the southern face of the Taylor's Bank, below low-water level and well outside the channel, of a layer of small lumps of hard stone, in such a manner as to revet or clothe its slope, and so to protect the underlying sand from erosion by the current. The total length would be about $2\frac{1}{2}$ miles.

The description of the work, as given in the notice issued by the Conservancy, is as follows:—"A stone revetment to the height of mean low-water mark, or thereabouts, of the southerly face of Taylor's Bank, in Crosby Channel, in the estuary of the river Mersey or Liverpool Bay, commencing at or near the southerly end of Formby Channel at a point situate 1,370 yards or thereabouts, measured in a south-westerly direction, from the beach mark on the fore-shore of the urban district of Little Crosby, known as the Crosby Beach Mark, and terminating at a point situate 5,360 yards or thereabouts, measured in a westwardly direction, from the said Crosby Beach Mark."

With a view to still further improving the channel, the Board are about to construct a dredger of three times the size and power of the *Brancker* and *G. B. Crow*.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITION OPEN.

THE Radcliffe electricity committee estimated a year ago that they would lose 500*l.* on the year's working, but instead they have made a profit of 40*l.* In the previous year they lost 900*l.* The unexpected increase in the number of consumers has been responsible for the profit.

THE City of London Electric Lighting Company have submitted proposals to the City Corporation to light experimentally a portion of Farringdon Street and Holborn Viaduct in three different styles, and at a considerable reduction on the present charge of 26*l.* per lamp per year. These demonstrations may be regarded as consequent upon the experiments made in Queen Victoria Street, Queen Street, the Billingsgate Market area and Fleet Street, where the lighting by high-pressure gas has superseded the electric current. The Charing Cross, West End and City Electricity Supply Company has been asked by the Corporation to submit similar proposals for demonstrating the most recent method of street lighting by electricity.

LESLIE WALKER FIRE ALARM.

In the description of the Leslie Walker fire detector in our issue of March 29, the lettered diagram showing the action of the detector was accidentally omitted. The missing figure we have the pleasure of now giving, the letters being those referred to in the original full description. The action is briefly as follows:—In the figure a mercurial bulb A is continually kept filled with mercury, from which a fine capillary tube B communicates with the partially filled compensating chamber C. On the right is shown the (normally empty) contact tube containing platinum contacts

A LARGE clock with Westminster chimes has just been fixed in Rothwell parish church, Northamptonshire, by John Smith & Sons, Midland Clock Works, Derby. The clock is fitted with all the latest improvements and has been made generally to the designs of the late Lord Grimthorpe. The same firm recently made a large clock and chimes at Irthlingborough Church in the same neighbourhood.

THE London and Lancashire Fire Insurance Company's report and balance sheet for the year ending December 31, 1906, is eminently satisfactory. The combined fire and

and F and forming the (normally) open portions of two electrical circuits. Usually, the mercury passes from A through tube B to chamber C on a rise, and returns to B on a fall of temperature. On a sudden or abnormal rate of rise tube B is much too small to carry off the flow and the mercury is instantly forced into the contact tube, thus bridging electrical contacts D and E, and later also E and F. The circuits are also bridged at a pre-determined degree of temperature, for when the chamber D is full the mercury of course flows up the contact tube. The closing of a circuit signals to those in charge.

TRADE NOTES.

BEFORE transferring their stock of furniture to the joint stock company into which the business was lately converted, Messrs. Oetzmann & Co. offer large reductions to their customers on goods which they may purchase.

accident premiums amount to 1,592,037*l.*, showing an increase of over 105,000*l.* The operations of the company, excluding San Francisco, have resulted in an underwriting surplus of 344,066*l.*, which, with interest of 58,949*l.*, makes a total credit balance of 403,015*l.* After making full provision for the company's loss at San Francisco of 925,000*l.*, increasing the fire fund by 40,000*l.*, and paying a similar dividend to last year, viz. 16s. per share, or 32 per cent. on the paid-up capital, the total reserve funds amount to 1,554,068*l.*, in addition to the capital of 2,280,000*l.*

AN interesting account, with illustrations, is given of "The Lost Tapestries of the House of Lords" by Edmund Gosse, in *Harper's Magazine* for April. They were designed to commemorate the Spanish Armada, and carpeted the walls of the Upper Chamber until the fire of 1834, but fortunately a pictorial record of them exists in the spirited engravings of John Pine, the friend of Hogarth.

BUILDING EXHIBITION, OLYMPIA, Stand No. 13.

The Building Trades Exhibition, Olympia.

A Great Success.

THE International Building Trades Exhibition began its official existence on Saturday last, when the Lord Mayor (Sir W. P. Treloar), attended by the civic officers, declared it open. His Lordship perambulated through the aisles, with Mr. H. Greville Montgomery, M.P., acting as cicerone, and manifested considerable interest in several stalls, where a halt was made to allow of inspection. Subsequently a large and influential company, chiefly composed of prominent architects, adjourned to the inaugural luncheon.

Mr. Montgomery, who presided, in proposing the loyal toasts, announced that the Prince of Wales had promised to honour the exhibition very shortly by a visit.

Sir Aston Webb, R.A., in proposing a vote of thanks to Sir William P. Treloar for opening the exhibition, said it was a duty which gave great pleasure to himself, and it was one that would meet with the approval of everybody present. This was an exceptionally busy time of year and contained few Saturdays in which the Lord Mayor was free to attend such functions. Therefore special honour had been conferred. The Lord Mayor must necessarily be interested in buildings, for the city of London without its buildings would not be much of a city. An old writer declared, "Show me a man's accounts, and I will tell you his religion." Sir Aston Webb amended it to, "Show me a nation's buildings and I will tell you its aspirations and its associations." The buildings of London can compare very favourably with those of any other city. St. Paul's is one of the buildings of the world, and a large number of more recent date are scarcely less conspicuous in their way, if only there was more room for their display. There is nothing, after literature, which reveals more clearly the importance of a nation than buildings. The present Building Trades Exhibition must be characterised as an extremely good one, and it called for congratulations to Mr. Montgomery after all the trouble he had taken. It promised to be one of the most successful, interesting and useful yet held. Such an exhibition can materially help architects to solve the numerous problems which have to be solved in the course of their daily work.

One of their trials was to find new buildings quickly veiled in grime and dirt. It was reasonable to look to the Building Exhibition for help in the solution of the problem of London smoke. Electricity allows of the production of heat without smoke. In his (Sir A. Webb's) opinion coal will become in fifty years entirely out of date. Another is the use of materials which will resist smoke, as may be seen in the new Savoy Hotel. A house designed by Mr. Halsey Ricardo, close to Olympia, might similarly be alluded to. Architects must be the principal customers of firms connected with the building trades. The qualities looked for by architects are beauty, durability, utility and colour texture, rather than perfection of execution and manufacture. Too much stress is sometimes attached to the latter. Architects have come to the conclusion that the cheapest thing is by no means necessarily the best. They like to see competition in quality rather than in price; competition in the latter brings in its train unfortunate results.

Mr. F. L. Dove (president of the Institute of Builders) said it was particularly appropriate for the Lord Mayor to open such an exhibition, where all the stages of a building are seen and which reveals all the advances made year by year towards a solution of domestic difficulties wrapped up in the habitation of houses.

The Lord Mayor said he was very pleased to be present and to have the honour of opening the exhibition. Nevertheless, he could not help feeling reminded of one occasion when almost as a boy he attended a "beanfeast" organised by a firm of builders. In the course of those proceedings one of the workmen got up to propose the health of a certain foreman, which he did in the following strain:—"What I like about Mr. Jones is that when he is drunk he sits down quiet like a gentleman and does not look much more of a fool than he does when he is sober." As Lord Mayor he undoubtedly took an interest in buildings, more especially in the Mansion House, which he enjoyed without the payment of rent or rates and taxes, and which he had been told was worth 50,000*l.* per annum. Though it was a

very nice building it was capable of great improvement. At any alterations he might initiate would benefit not himself but his successors. Another building which especially appealed to him was situated in Norwood, and its use might be expressed in words overheard from a passer-by, who alluded to it as the house where "the Lord Mayor lives when he is not lord mayor." He felt sure that the exhibition must do a great deal of good to everybody connected with the building trades, and it was a duty to attend it. It brought inventions under the notice of people who ought to know of them. However, to his mind it was incomplete in so far as it contained no display of high-class carpets—an essential part of a well-equipped house. He drank to the success, the continued success, of the Building Trades Exhibition and of Mr. Montgomery. Each exhibition doubtless was better than the last, just as had been said for even hundred years about the Lord Mayors of London.

Mr. H. Greville Montgomery, M.P., said that he might use a Parliamentary expression, and describe the proceedings as part of an unauthorised programme. He was very delighted to receive in that room a small amount of praise, because for the last three weeks he had been the subject of ceaseless badgering on the part of exhibitors. His effort had been to make the show a success on the lines he had laid down ten or twelve years ago at the Agricultural Hall. Previously the principal avenues were filled with cabs, café chantants, sweets stalls, shooting galleries, and other features of a fair. All that had been changed, and nothing is now admitted that does not appertain to the building trades. The present exhibition could be claimed to be the finest and most comprehensive trade exhibition ever held in this or in any other country. There was no need for such attractions as dancing saloons. It had been complained that the exhibits were too substantial. In his opinion that was a good fault. The floors could be walked upon in safety, and a visitor could lean against walls without a collapse. He sincerely hoped that the exhibition would bring prosperity to the building trades.

We may now turn to the most important among the stands.

Messrs. Sharp, Jones & Co. show their patent Brandram joint as applied to pipes of stoneware, concrete

or iron. A steel band dipped in hot bitumen is placed over the joint made by two pipes. The band is made tight by a screw cramp, and finally fastened by means of staples inserted in the eyes of the band from each side. Rock concrete is also made by this firm in the form of tubes, manholes and roofing tiles. The cement used complies in every particular with the conditions of the British standard specification for Portland cement of the Engineering Standards Committee. Their tubes have been used for more than thirty years for sewerwork, &c., and are made of a very dense, impervious and heavy concrete, composed of selected Guernsey granite and Thames Portland cement. Messrs. Sharp, Jones & Co. adapt the material to serve as circular manholes for sewers and house-drains and other purposes. The War Office and Admiralty recognise the merits of this economical patent. The manhole has a height of 5 feet 9 inches to the point where it narrows to the shaft of 27 inches diameter, which may be continued to any height and at a price which is less than with any other material. Rock concrete serves a no less effective purpose as double-lock roofing tiles, where its economy is further illustrated. Travellers can inspect them in many parts of the world, such as the colony of Nigeria. The fact that they keep buildings cool is likewise a recommendation to architects in this country.

The Well Fire Company, Ltd., again strike out a new line in the "Pyramid" grate, which shows their original patent well fire adapted to suit peculiar conditions. Under certain circumstances the low-placed type of grates with their great heat may introduce an element of fire risk. To remedy this the "Pyramid" is fitted with a false hearth of firebrick fixed on a cast-iron frame, which forms a warm-air chamber beneath the fire and a cool air-chamber above the hearth for the protection of any timberwork. The result is that all possible danger is obviated. The company recommend the use of their iron frame for securely holding the faience slabs round the fireplace. Their stand is a large one, and shows the multifarious departments of their business. The Well Fire Company are as artistic as they are practical, and prove it in their chimneypieces, tiling and fireplace furniture, as well as in the usual forms of art metal-work. Simplicity and refinement are two conspicuous qualities of the display.

The *Nostell Brick and Tile Works* point with pride to the colour of their goods as distinctively marking them. It approaches chocolate. The fact that they are non-vegetative must be a recommendation in the eyes of many architects, and that they are non-absorbent in the eyes of all. The firm turn their splendid materials into all the customary forms found in brick and tile works.

The effect of otherwise imposing mansions is sometimes ruined by a mean front entrance-door. The architects who are responsible should inspect the stand of *Elliott's Moulding and Joinery Co., Ltd.*, where they will learn how handsome and grandiose a door in oak and yellow pine may look. It was made for the front entrance of New York Lodge, Bourne End—a Thames residence for a wealthy American, and suggests welcome and hospitality. The folding-door measures 11 feet 6 inches by 8 feet 6 inches, with a fanlight, and the outer face is of fumed and waxed polished oak. Their contract on this building comprised solid Spanish mahogany panelling, &c. It is pleasant to know that the owner did not insist on importing his fittings from the United States, although woodworking flourishes there. The stand shows in many different ways that this company are well equipped for satisfactorily helping architects whatever may be their requirements in moulding and joinerywork of the highest class.

Most building owners if offered a choice between marble and glazed tiles at similar prices would select the former. The *Manu Marble Company, Ltd.* come forward with that alternative. Their material is composed of marble chippings subjected to a pressure of 400 tons, and has the appearance and properties of the natural stone. The markings and colour go right through, and the surface may be highly polished. All varieties of marble are imitated or manufactured with equal readiness, and the architect can confidently order any colour scheme his fancy suggests. The standard size of slabs or tiles is 16 inches square, or if an oblong form is preferred 14 inches by 21 inches. The difficulty of exercising the enormous pressure required entails limitations as to dimensions. These, however, are gradually becoming increased, and the company will shortly be able to put on the market blocks 4 feet by 3 feet.

Very few people are so fortunate as to go through life without acquaintance with a smoky chimney. With most

it is begun in early youth and continued till old age, in spite of many efforts to break it off. With the irresistible march of science the creation of remedies of the nuisance may be expected to attain increased effectiveness. One of the most recent chimney cowl is that patented by Mr. E. G. Wright, and named the *Twentieth Century King Chimney Cowl*, which is the climax of nearly forty years' successful practice as a ventilating specialist and chimney expert. It is non-revolving, but is constructed so as to make an up-draught, whatever may be the direction of the wind. The outside air enters the cowl in an upward direction and receives a double circular motion, thereby driving the smoke out. The same principle is applied to "King" ventilators, in which the outside air enters at the base in two places and vigorously drives out the vitiated air. Mr. E. G. Wright also has a patent atmospheric stove much used in greenhouses and other places.

The solidity and strength of "Mack" partitions are again suggested by the stand of *J. A. King & Co.*, the British manufacturers, who have erected a lofty structure with partition walls of different thicknesses. Their fireproof ceiling encloses the structure above. The interior surfaces are treated in various ways. When steel is used for floor beams the slabs are laid on the lower flanges, which can be covered with concrete or other material. In one test carried out on a 2½-inch slab partition 14 feet long 9 feet high, the total load was 32 tons, giving a floor load of over 3 cwts. per foot super. In another test of a similar slab the load was 6½ cwts. per square foot; the distance between the joists was 2 feet 6 inches. Their 5-inch "Mack" pugging blocks for fireproofing projecting shop roofs are made to fulfil the requirements of the London County Council Building Amendment Act, and are obtainable to any width to fit the space between the joists. The stand shows their other specialties, and photographs suggest the quantity of business done.

In the United States a high reputation has been won by the *Trussed Concrete Steel Company*. About twelve months ago they invaded Great Britain and have established works in the Old World. As indicating the demand for the bars we might say that in the past year altogether 36,000 tons of their bars were sold, which were distributed in over 1,700 structures. The Kahn-trussed bar is equally useful

WINCHESTER HOUSE, OLD BROAD STREET, E.C.

in a simple bridge, a factory, or in a gigantic structure like the Marlborough Blenheim Hotel, Atlantic City, New Jersey, U.S.A., where the walls are entirely of reinforced concrete. The latter is a great building, some 560 feet long, from 50 to 200 feet wide and nine storeys high, with a dome rising to thirteen storeys. Nevertheless it was completed in less than six months. The trussed bar was used in all the columns, girders and floors. Specimens are shown of bars in four sections, which are adapted for beam and arch requirements in every form. In one test a panel of concrete reinforced with the trussed bars was loaded to 2,000 lbs. per square foot; the deflection was only 3-32nds inch. In an American hardware house the floors of the nine storeys are designed to carry up to 500 lbs. per square foot with safety. In this structure all the columns, beams and slabs are concrete reinforced with the Kahn-trussed bar. It will be seen that the *Trussed Concrete Steel Company* have arrived with the prestige of wide and diversified experience behind them, and were from the first almost certain of success.

Messrs. Carter & Co. (Poole, Dorset) are showing specimens of their productions, including floor tiles, mosaics of all sorts, terrazzo, marble and ceramic-glazed wall and hearth tiles, terra-cotta and faience. The fireplace interiors with wood mantels, built up of briquettes with faience hobs and arch bricks, glazed hearth and kerb all to match, should be noted. But their special exhibit this year is a varied selection of glazed tiles for decorative purposes, fireplace and furniture panels, and dadoes. Many of these are in the leadless glazes in which quaint design and harmonious colouring, with charming variety of tone, give special distinction. The slip outline process, too, gives the artist a free hand. Some may prefer the restful effect of a more uniform

tone of colour, as in the older lead-glazed tiles. There is a collection of choice garden pottery. It may be interesting to note in connection with the leadless glazes that Messrs. Carter are carrying out a contract to supply and fix some thousands of yards of these tiles for the new Home Office.

The principle of alternative speeds has been applied to many forms of mechanism, and Messrs. *Hammond & Champness* have just adapted it to lifts. They mean to protect themselves by a patent. The two-speed goods lift shown is fitted with a line by means of which the ratio of the gear can be instantaneously changed. The high speed will be a great boon where the cage has to ascend to a height, provided that the load in it is light. In the case of a lift capable of carrying 6 cwt. the additional cost of the two-speed equipment would only be 10*l*. Besides this novelty, Messrs. Hammond & Champness invite an inspection of their other types of lifts, as well as an iron staircase and models of iron roof principals.

An unsolicited testimonial of a striking kind from England's greatest architect as to the sterling merits of Weldon stone is shown by Mr. *John Rooke*, of the Weldon Stone Quarries, Kettering. It came from Inigo Jones in 1640, and consisted of a block showing the heraldic bearings of one of his noble patrons. After so long an interval the carving still remains sharp, while the surface has admirable colour. Architects can hardly fail to be influenced by the sound judgment of their predecessor in the selection of stone. It is believed the stone was used in Old St. Paul's. It certainly was for the restoration of the pinnacles of Rochester Cathedral, and three years ago for refacing the whole of the central tower. The stone is easily worked, is cheap, and has been extensively used for ashlar and dressings in ecclesiastical and public buildings and mansions.

It is pleasant to know that the old London clamp brick has not been entirely excluded. Messrs. *Dawson & Co.* have several alongside of other fundamental accessories to building. An improved stable gulley with a reversible base and perforated bucket under the grid has been extensively used. Part of the stall is roofed in with "Eternit" slates, and faced with sheets of it. The French natural marble stone "Echaillon"—of which there is only one quarry in existence—is shown in its three colours.

Avery's Self-contained Truck Weighbridge.

W. & T. AVERY, Ltd., Soho Foundry, **BIRMINGHAM.**

The sanitation enthusiast—and who is not one in some degree?—will find attraction in the new patent basins and sinks of the *Ajax Sanitary Company, Ltd.*, who have determined to draw up the death warrant of the long familiar plug basin with its immovable overflow openings. Experience has shown that in the old-fashioned basins objectionable matter accumulates behind those openings which cannot be cleansed out. To remedy this the Ajax Company fit a shutter or sliding valve in a recess at the back of the basin, the top of which is either cut away or fitted with a grid to allow the water to overflow. This shutter may be of any metal or rubber, and run in grooves or made to fit against the sides of the overflow passage or basin. It is simply lifted out or raised to allow the water after use to escape, which it does with great rapidity. Two years have not elapsed since their introduction, and yet they may be seen in the Harrow Cottage Hospital, London County Council schools, and have been ordered, amongst other places, for St. Bartholomew's Hospital and the Manchester Royal Infirmary. In order to indicate the ease with which the basins and fittings are kept to look as good as new, visitors are allowed to wash their hands.

"Windmill" brand roofing tiles, ridges and finials, &c., are shown by *Messrs. Watson, Nelson, Ltd.*, who have their works at Napton-on-the-Hill, near Rugby. Their patent fluted-faced tiles are designed to keep out the severest rain storm from a house-top. The channels are carried to about 2 inches above the bottom edge of the upper tile, and effectually prevent water being forced up and on to the roof timbers. They are especially serviceable where a roof with a flat pitch is required. *Messrs. Watson, Nelson, Ltd.*, are supplying the tiles for a building estate of 16 acres in process of development at Barnes, across the Thames. They also make adamantine pavings, bricks, pipes, &c.

It would be a difficult matter to send a working passenger lift round to a possible purchaser on approval. *Messrs. R. Waygood & Co., Ltd.*, have overcome this impediment to business transactions by installing a complete electric lift which conveys passengers to the gallery overhead. As the safety-gear is guaranteed the public must be content to do without taking part in a breakdown test. Some people may derive satisfaction from the knowledge that Waygood lifts are installed in Buckingham

Palace and the new War Office. A specimen lift enclosure and gate may be seen. A model is set up of their familiar automatic electric passenger lift, of a hand-power service lift and an electric friction hoist for builders and contractors and for warehouses, stores and factories. The latter may be hired.

Mintons, Ltd., can only give a faint indication of the number of ways they are prepared to undertake the decoration of a wall with their tilings. The dadoes, panels and friezes offer endless scope for variety of artistic handling. Some prefer an intricate raised pattern, while others like plain surfaces. Either will find their taste gratified. The combination of colours and forms is most pleasing. A panel, designed by Mr. L. V. Solon, showing the full-length figure of a girl, and another of a yacht under sail, are excellent specimens of this class of work, and worthy of a firm of such repute.

Messrs. R. H. & J. Pearson, Ltd., are equally ready to supply dainty fire-grates, with corresponding chimney-pieces, as large kitcheners or cast-iron baths. An excellent contrast is afforded by a fireplace made up of a Sheraton wood mantel with brass interior, into which small Wedgwood panels are fixed and a "Commonwealth" kitchener. The latter is made with a self-clearing fire, which precipitates the ashes into the sifter below. It consists of wrought-iron ventilated roaster and oven, Eagle patent lifting fire, tile coverings fixed with brass screws; bright plate rack, full register top plate, long handle dampers and polished wrought bright fittings to oven doors. It is made in segments so that the parts which come in direct contact with the fire can easily be renewed without disturbing the range.

At this season of the year more than any other the novelty shown by the *Grooved Wall Paper Company* is sure of attracting interest. By the process shears or machines for trimming are dispensed with, the paper on a slight pressure tearing along the perfectly straight grooved line. The trimming can be detached while the paper is being hung. The company are London agents for the "Marpedo" paints and enamels.

The Roman mosaics and terrazzo flooring of the *British Mosaic Art Co., Ltd.*, unpretentiously display their merits. The company are also workers in parquet and wood blocks. They make flooring with curved angles for hospitals.

National Telephone: 161 OLDHAM.

Messrs. Pinchin, Johnson & Co., Ltd., offer the following simple recipe for obtaining a perfect paint finish:—Two coats "Minerva" opaque white, one coat special "Satinette" undercoating and one coat "Satinette" either gloss or flat. To illustrate their interpretation of what perfect finish means they have set up a "Satinette" staircase which may also be said to serve as a mirror, such is its smoothness and gloss. As a contrast the newels are treated with the flat variety of this white enamel. But like "Minerva," it may be had in all colours and is applied like any other high-class enamel. One gallon of "Satinette" on a hard smooth surface has a covering capacity of about 75 yards super; thinning will only reduce this. Messrs. Pinchin, Johnson & Co. place the following guarantee on every can of "Minerva" paint:—"The paint contained in this package is made only of the best materials obtainable, mixed to correct proportions—genuine English white lead (carbonate), genuine white zinc (oxide), best linseed oil, pure American turpentine and, or where necessary, colouring matter for tinting. Sufficient driers are added to insure proper results."

The Ratner Safe Company, Ltd., must be known to the burglar profession and avoided in consequence. But fire does not show the same discrimination and has wasted much effort in futile attempts to injure the contents reposed in the safes. In the recent fire in Featherstone Street, London, the entire building was burned down, but the safe survived the ordeal with no more than surface damage. All the safes are on the twelve-corner-bent principle out of one solid steel plate. Their patent interchangeable key lock is one to which numberless different keys can be made, whereas only the key which last locked it can unlock it. The firm have supplied a safe to the King at Balmoral and done much work at the Chancery Lane Safe Deposit. Over 13,000 Ratner party-wall doors have been delivered to Oxford Street firms, Army and Navy Stores, &c.

A technical course as to the manufacture and qualities of Portland cement is offered free by the Associated Portland Cement Manufacturers, Ltd. Their stand shows the raw materials and follows them through their various stages. A complete testing apparatus in conformity with the requirements of the British standard specification has been set up and tests are made "while you wait." Many of the largest contractors in this country have purchased from the com-

pany a Gilbreth's patent portable gravity concrete mixer. Those unacquainted with it should inspect the model shown of this labour-saving appliance. The mixer is a steel trough filled with numerous rows of steel pins and deflectors, staggered in order to thoroughly mix the sand, cement and aggregates as they gravitate through the trough. The machine may be hired as well as purchased. It is found that four men shovelling into a gravity mixer, which delivers direct to barrows or other conveyers, will completely mix a cubic yard of concrete before an equal number of men mixing by hand will complete one dry turning. In other words, four men and a gravity mixer can mix as much concrete, and mix it better, than twenty men can mix by hand with shovels. Samples of ferro-concrete cement are shown all ready for immediate use.

A handsome balustrade with steps placed against the gallery railing by the *Empire Stone Company, Ltd.*, is so inviting as to tempt the visitor to walk up them if unchecked. The result might be unfortunate, as the top step is on a level with the top of the gallery railing, and the curious visitor might meet a similar fate to that of Humpty Dumpty. However, a close inspection of the stone may be made equally well on the floor level, and the claim of the company to be the best finished stone on the market may be judged. There is a lengthy stretch of footpath laid with "Empire" stone, as put down in innumerable towns both great and small, as well as a half full-size sample of ferro-concrete fireproof flooring. The Narborough Works, near Leicester, always contain a large and well-matured stock of stone, which enables the company to cope with any number of contracts.

The *Enderby and Stoney Stanton Granite Company, Ltd.*, use their quarries for the production of setts, dressed kerbs, trams or wheel stones and other purposes. Specimens of different classes of worked granite are included. The setts are clean cut. Broken granite, red, grey or blue, for macadam is supplied.

"Chez-lui" is applied as a trade name by Messrs. J. Price & Son to decorative and bath enamels, washable distemper, gold paints and aluminium enamels. They are enamel paint, colour and varnish manufacturers, enamellers and japanners. The "Chez-lui" special bath enamel is offered to the amateur for renovating his bath himself.

TUNSTALL & CO., Ltd., Leeds Bridge, LEEDS.

ESTABLISHED 1837.

Telephone 4120 (two lines).

Telegrams: "TUNSTALLS, LEEDS."

The accompanying diagram will show the valuable new patent of *Mr. W. M. Glendinning*, who, in his character of hot-water specialist, has achieved great success. A is a hot-water cylinder, B the hot-flow pipe from it, C the return-pipe to cylinder and boiler, D the flow connecting the kitchen boiler, K, with the cylinder, and E the return-pipe; F is the cold-water supply from the cistern,

H, which has a safety or expansion pipe, G; L is the draw-off tap, while M is the patent heating coil, which is connected to flow and return-pipes of cylinder. Underneath the coil may be placed a Bunsen burner or an oil reservoir. The water passes through the coil in a thin stream, and almost instantaneously becomes hot. The patent must in summer time prove an invaluable adjunct,

for the full supply of warm water throughout the house is always available independently of the kitchen fire. In the winter it removes the bogey of burst pipes and boilers. Mr. Glendinning has applied the same principle to a geyser in which the cold water enters at a temperature of 30 degs. and leaves at 120 degs. Six small gas-jets enter into as many pipes with 144 holes placed under coils. The water so quickly heats as to come out as boiling in thirty seconds if the flow is shut off, and a hot bath costs no more than a halfpenny. Water companies allow it to be connected directly with the main. The appearance of the bath-room is often marred by the necessity of an unsightly flue; in this patent no flue is required, for there are no fumes and no smell. Both patents will repay examination.

Felts under many forms are offered for examination by *F. McNeill & Co.*, as well as damp-courses, bitumen sheeting, fibrous plaster slabs, slag-wool slabs, insulating papers and other things which, though hidden in the interior of a building, are often vital to its complete enjoyment.

Man-o'-war teak wood garden seats, built out of old Navy ships, would impart romance to the most commonplace garden. They may be had from *Castle's Shipbreaking Company, Ltd.*, who show timber put to many ornamental uses.

The *Ruberoid Company* have constructed a sloping roof over their stand and put it on their well-known and much-used roofing material. On the floor they show it employed as on a flat roof. The goods station and warehouse recently erected by the North-Eastern Railway Company at Newcastle-on-Tyne has a roof area of 70,000 square feet, which is entirely covered with this fabric. As a contrast to this, its use on a cottage erected at the Garden City, Letchworth, may be cited, suggesting that it is as applicable to a hen-house as to a palace. The terrace roof of a cotton mill in Lille, France, was covered with ruberoid and converted into a tank to hold 27,250 cubic feet of water. After five years the owner was able to say that it showed no signs of a leak, ample proof of how impervious it is to water. A similar job was subsequently executed at another factory. The company have established a reputation for their insulating papers, damp-course, sarking felt and other goods, including various preservative paints for wood and metals.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORCKER, Ltd.,

GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.

London Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent, where the "Drawwell" can be seen in action.

When Victoria stone was introduced in 1868 its principal scope was thought to be in pavingwork. But architects insisted upon sharing in the advantages of the new material, and the *Patent Victoria Stone Company, Ltd.*, was launched upon the more artistic, if not more useful, paths of architectural decoration. Their stand portrays the range of their work, which can be made to serve stable flooring and classical colonnades with equal readiness. Two paving stones shown, which might almost pass for new, have a splendid record for wear. One of these was removed from London Bridge after fourteen years' use, during which it is computed 640 million pedestrians passed over the bridge. The other was laid in the entrance hall of the South Kensington exhibitions, and after twenty millions had used it the wear was no more than $\frac{1}{8}$ -inch. The stone is applicable in 2-inch slabs as walls for bungalows, pavilions, country railway stations, &c. A large moulded porch to be set up at a metropolitan gasworks office has been brought down for display. More delicate carving is seen on the detached slabs. Victoria stone may take multitudinous decorative and useful forms.

First and foremost, the *Bostwick Company, Ltd.*, have been makers of collapsible gates for the past twenty years. A natural development of their business was in the direction of ornamental wrought ironwork and art metalwork. A novelty in their gate department is Clark's new improved patent collapsible steel gate for lifts, with or without automatic gearing for closing. The feature of it is the complete filling in the whole gate with lattice, leaving no spaces at the ends of each set of lattice as in the original collapsible gates. Its construction removes the usual liability to foul when the gates meet with an obstacle in opening. The stand should be inspected by students and others interested in art metalwork as applied to the requirements of everyday life, whether in the form of entrance gates, vanes, railing, screens, signs, electric, gas and oil fittings, name plates, engraved or *repoussé* work.

The *Hempstead Patent Brick Company* have built up their partition blocks as walls for the purposes of display. They can point to severe tests as to their powers of fire-resistance and their strength, and they produce a material guaranteed fire-resisting to the melting-point of steel, *i.e.* 2,786 degs. F. In one test a 3-inch partition constructed of 12-inch by

6-inch by 3-inch blocks, and jointed with mortar consisting of sand of the same material as the blocks and Portland cement, and another partition of $4\frac{1}{2}$ -inch blocks were set up and enclosed. Between them two short lengths of steel joist (partially protected inside hollow blocks) were placed. The fires were stoked up to white heat for eight hours, with the result that the exposed ends of the joists were partially melted, while that within the blocks was unhurt; the blocks themselves were uninjured except in one case, which was due to the joist expansion, and the partitions were quite sound. The results were a triumph for the makers. In a strength test lasting several days a $2\frac{1}{2}$ -inch hollow terracotta partition sustained a distributed floor-load of 640 lbs. per foot super. In another, with a 3-inch partition, the load was 660 lbs., and was then stopped on account of the serious deflection of the timber lintels. These effective patent blocks have been fitted into tee section iron frames, thinly plastered over, and used as fireproof doors, either hinged or sliding. In addition to being fireproof, the "Hempstead" blocks are soundproof.

Mansfield Bros. have as their specialty sanitary goods of "Felspeene" ware, and show a three-range lavatory in it. In addition to these and allied appliances they sell art tiles, "vitrified" flooring tiles, mosaics, briquette fire-places, &c.

Mr. W. E. Farrer shows his improved automatic sewage-distributor at work, which is designed especially for small installations such as country houses or villages. The apparatus consists of a galvanised wrought-iron tipper (divided longitudinally into two sections) supported on gun-metal lined bearings. The effluent from the liquefying-tank discharges directly into it. The distribution is effected by concentrating chutes, to which are connected continuing perforated cast-iron channels with flanged joints, and drilled with holes at their lowest point. The liquid, when converged by the chutes at the moment of the fall of the tipper, creates a wave which rushes down the channel, giving a head sufficiently great to spray the contents through the small holes on to the filtering media. By the double action of the tipper a period of rest is allowed to each half of the filter, and aeration is thus insured. In addition, they show many other productions which they as engineers and sanitary specialists have placed on the market.

Show Rooms: 4 UPPER THAMES STREET, LONDON, E.C.

The anatomy of the *Columbian Fireproofing Company's* system can be studied at their stall, which shows concrete fireproof floors and roofs, as well as armoured cement water and sewer-pipes. The Columbian system may be briefly described as consisting of special ribbed steel bars from 1 inch to 2½ inches in depth, embedded in concrete and suspended in steel stirrups over steel joists, and 3½ inch, 4 inch and 5 inch heavy ribbed bars between main girders or resting on the walls to eliminate the ordinary steel joists. Few architects, engineers or contractors can be ignorant of the system. The "Bonna" armoured cement pipes were first manufactured in France some ten or twelve years ago, and much more recently were introduced into Great Britain. The Paris Municipality early showed their confidence in the invention of M. Bonna by laying down 250 miles of the pipes, varying in diameter from 1 foot to 12 feet, for high-pressure and sewage. At Swansea an 18-inch armoured cement water main standing a working pressure of 185 feet head has been completed for the Corporation. A contract for sewage pipes is now being carried out at Acton.

The "England" Works again show their all metal self-contained cloak-room fittings. Since we saw it at the Sanitary Congress last year at Bristol, we believe that it has been fitted with a small revolving mirror—an indispensable adjunct to a cloak-room fitting, by which users can give finishing touches to their personal adornment, and with a collapsible seat which would render the putting on and taking off of boots a matter of comfort instead of a gymnastic trial. Another exhibit is their automatic ball-bearing double-action door, pivot and check, which may be quickly fixed, and works simply.

The adjacent utilitarian exhibits act as a foil to the pleasing stained glass shown by *Messrs. Campbell & Christmas*, who have their studios in Brompton, S.W., from which they have executed work in various forms for well-known architects. In addition to noteworthy stained glass they exhibit glass and marble mosaics, metal casements, leaded glass, mural paintings, marblework and opus sectile decorations. Architects anxious to summon the aid of the arts and crafts to perfect their buildings should visit the Brompton studio in order to realise that willing and competent co-operation is waiting to be called upon. A small

piece of wire glass, approved by the London County Council as fire resisting, becomes a thing of beauty in the hands of *Messrs. Campbell & Christmas*. Opportunities for introducing decorative glass into secular buildings are constantly allowed to pass unheeded. Fortunately a revival of interest in it is becoming manifested in contemporary architects, and the possibilities of the material may soon be realised.

Among the many novelties which are being shown to the public at Olympia for the first time must be included Carey's "Sesame" door at the stand of *Messrs. Pemberton, Arber & Co.* in the Annexe. The invention is only a few weeks old. The doors of the model stand on a slightly raised platform, which being depressed by the weight of anyone over five stone, automatically swing open to their fullest extent, and remain so until the person has passed through and steps off the platform on the other side, when they close. The gear must be simple, for the pit required is only 8 inches deep. A single door, it is said, can be fitted up as easily.

The *Silicate Paint Company* have erected a full-sized bungalow decorated inside and outside with their well-known washable water paint "Duresco." Outside is a tiled roof, lined bricks and a good imitation of rough-cast—all in Duresco. The interior further exemplifies the capability and beauty of the material. The walls show a peculiar and charming softness. The frieze decorations lend additional charm to the general effect. Some twenty panels decorated entirely with Duresco are also exhibited, offering a wide range of colour schemes. The decorations are carried out by stencilwork, and the cost of reproduction in a practical way is within the reach of all.

The *Acme Flooring and Paving Company* (1904), Ltd., make an interesting display, showing stretches of flooring laid with various woods such as pine, jarrah, oak, teak and deal, each having perfect joints and a smooth level surface. The company are prepared to give a five years' guarantee with flooring laid on W. Duff's "Inmovable-Acme" system. A striking recommendation as to the efficacy of their dowelled paving is its adoption in 1895 by Sir J. Wolfe Barry for the roadways of the Tower Bridge, where particularly severe wear and tear had to be provided against. The company might be taken for numismatists from the number of medals they have won.

ARTHUR L. GIBSON & CO.,

19, 20 & 21, TOWER STREET, UPPER SAINT MARTIN'S LANE, LONDON, W.C.

If it be accepted that the attainment of perfection is impossible in mundane things, it follows that there is always room for improvement, which is revealed to all those who have the power to see. The person that can and does profit by experience is worthy of more respect than one who rests serenely content with his original perfections and imperfections. When Messrs. Ellkay & Cornes, Ltd., first showed their combined range, copper and bath its merits were recognised at once. Unspoilt by success, the firm

were not satisfied that they had carried their idea to its limits, and they now have improved on that first type. The parts to be cleaned are now brought down to a minimum, and there are no tiles. The fire opening is smaller, and less floor space and wall space are taken up. On the scullery side is a large top and opening to the copper, and plenty of headroom. Finally, there is Mr. Lancaster's new copper, which is shaped like an ordinary copper, but on the grate side it projects and so meets the back of the kitchen fire. Consequently, when the fire is alight the water is always hot, and it is not now necessary to divert the heat from the oven to boil the clothes or to provide a bath. Then there is the "Ellkay" folding bath, with or without a cabinet, and many other housing specialties

There is peculiar appropriateness in the presence in the exhibition of a stall filled with a selection of the books published by B. T. Batsford. There must be few people connected with the building trades who do not owe a debt of gratitude for help received in one or other of the volumes which cover so wide a range of technical knowledge.

Joseph Richmond & Co., Ltd., offer to the notice of builders a self-sustaining lift gear which is complete on one cast-iron bracket, and has no detached parts. It may be fixed by any unskilled workman, as it cannot be put out of truth. The necessity of a brake cord is removed. Owing to a regrettable confusion as to dates the company have not been able to set up their specialty—a perfect automatic electric lift (Richmond & Carey patent).

The Carron Company elected to exhibit only their stoves, interiors, dog grates, hearths and wood mantels. The numerous grates are as attractive in design as they have ever been. The experience of the company in the production of grates goes back to 1780. Some years ago they determined to reproduce these eighteenth-century examples and were assisted in doing so by the advice of Mr. J. Kinross, the architect. Complete artistic and financial success has rewarded the experiment.

Seasoned hardwoods from many climes have been brought together by C. B. N. Snewin & Sons, Ltd., including mahogany wainscot, teak, walnut, whitewood, kauri, curly pitch pine, and English and Borneo teak. The patent automatic self-folding doors shown are a new patent of which they are the sole concessionaires. Their protection from draught is scarcely less useful than the fact that they are panic-proof.

The New Expanded Metal Co., Ltd.—For years the Expanded Metal Company have occupied a stand at the Building Exhibitions, and a visit has always proved instructive. They have to some extent re-erected their stand as at the previous Building Trades Exhibition, viz. a light steel-framed building standing well off the ground, revealing floor, external and internal wall and ceiling fire-resisting construction. Expanded metal is made into several forms, such as lockers, builders' screens, workshop divisions, fencing, baskets, wire guards, &c. The barrel roof of the stall is of granite plaster on the metal. The applicability of the material to culverts is displayed.

HIGH QUALITY. LOW PRICES. PLEASE WRITE US.

The *Clee Hill Granite Company, Ltd.*, possess the Titterstone quarries in South Shropshire, about six miles from Ludlow. We are told that the whole of Clee Hill is covered with a strong basalt or dolorite varying in thickness from 120 feet to 240 feet. The material is not made into fanciful forms but fulfils a vastly useful purpose as setts, macadam and chippings. The Home Office describe it as "almost perfect as a roadstone." The firm have on their books as customers county councils and other public authorities throughout the country.

Granite concrete is used in sewer tubes, "Aqueduct" invert blocks, paving slabs, dressings, &c.; all of which are shown on a generous scale by *John Ellis & Sons, Ltd.* The sewer tubes may be armoured and unarmoured, circular and elliptical. At Golder's Green Estate, Middlesex, they supplied 36-inch steel-ribbed granite concrete tubes. The company have a patent breeze concrete porous pipe for land filtration and filter beds.

A businesslike display is made by *E. C. Young* of American hardwoods, whitewood pine planks, mahogany, turned newels and balusters, mouldings of every description, three-ply, compoboard, prepared oak flooring, overdoors, hand-rail, porchwork, &c.

Messrs. Perrett Bros. take their clay from the Woolwich and Reading beds, which in itself is something of a guarantee as to quality. Out of it they make pressed sand-faced red bricks, ridge tiles, finials and chimney-pots. The splendid colour is natural, and consequently goes right through. Their ridge tiles are conspicuous for their uniform straightness, and are of a hard texture.

The decorative capabilities of "Emdeca" are forcibly shown at the stand of the *Emdeca Metal Decoration Company, Ltd.*, and the *British Stamped Metal Company, Ltd.*, which attracts many visitors. "Emdeca" is made of flexible thin gauge zinc sheets, which can be cut with ordinary shears and bent around the sharpest angles without injury to the surface coating. It has a sale of 150,000 square yards per year. The roof of the stand is divided by seemingly two heavy transverse beams into four coffers with panels and coves, the whole being made of stamped steel. The Emdeca metal tilings exhibited are particularly successful, and some of the patterns would please the most exacting æsthetic taste.

The "Heaped" fire is again shown in action by *Messrs. Bratt, Colbran & Co.*, the patentees and makers. Sir Aston Webb, R.A., as reported above, laid particular stress on the crying need for a decrease in the amount of smoke pollution of the atmosphere of London and all busy towns. The "Heaped" fire is put forward as an answer to that need, as giving a steady incandescent fire of perfect combustion as well as throwing a maximum amount of heat into the room. They show the fire set in various pine and hardwood chimney-pieces, together with brass and copper stoves, iron mantel registers, &c.

The *Patent Indented Steel Bar Co., Ltd.*, have not yet had sufficient time to establish themselves as firmly in this country as they have in the United States, where they have assisted in the erection of many remarkable structures, including the Butler Bros. Building in St. Louis, which is the largest building of monolithic construction in the world. A double wood frame set up holds photographic slides of some of their other American contracts. If a similar frame is shown at the next Building Trades Exhibition we may expect to find the slides illustrating successful contracts in Great Britain. Several well-made models clearly demonstrate the methods of adapting the Indented Bars to floors, culverts, retaining walls, concrete piling, reservoirs, sewers, bridges and tunnels, and indicate the perfect provision for shearing stress requirements and the continuous mechanical bond it makes with the concrete, which renders slipping impossible. It is important to understand that the company do not carry out construction work themselves, but supply designs free of charge, and then sell the bars. They are ready to obtain tenders from firms who have already carried out work for them or to sell their bars to any contractor desired.

A working model of their patent revolving sprinkler is shown by *Messrs. George Jennings, Ltd.*, together with full-sized apparatus employed for sewage disposal, including a gauging indicator. The points claimed for the sprinklers are that they are jointless; there is no loss of head, as the head of liquid on the distributing arm is the same as at the source of supply; the centre tank has protected ball bearings; there may be either continuous or intermittent working with varying flows; they are powerfully made and are unaffected by the wind.

COOKING, LAUNDRY, HEATING, VENTILATION, Etc.

The Lord Mayor of London, in common with a large portion of visitors to the present exhibition, manifested interest in Mr. Prior's display. His heat distributor fully described by us on its appearance at the last International Congress at Bristol, and we need only mention that it is again in operation, and as a consequence wins a praise from everyone who sees it. Mr. Prior has more turned his inventive talents to account and produced a patent geyser grate and boiler which has the same simplicity as the distributor. An ordinary living-room fire is equipped at the back with pipes and a radiator. When special heat is required for the latter a sliding plate at the top is brought forward and converts it into a closed fire. The front may be closed by the Venetian bars, in which case the fire will be alight for many hours without attention. The boiler shown supplies two cylinders of 30 gallons and 20 gallons with hot water. An accidental proof of the boiler's efficacy was afforded this week. The fire was allowed to go out when Olympia closed on Saturday night, and on Monday morning the water was still hot although the fire had been cold for eighteen hours. Mr. Prior has answered the demands for something which will supply hot water for domestic purposes as well as heating stoves at a very cheap rate.

"Carrara" ware, made by Messrs. Doulton & Co., as a material for exterior architectural effect, is shown by a large handsome window frame which is to be set up at the Manchester House, Piccadilly. The rusticated columns are green and white. Many other colours are procurable. The same washable ware is used for fireplaces. The firm's w.c. doors are intended to be introduced where only a narrow depth of space is available. They open in the middle and are fitted with self-opening hinges. The Doulton potteries are represented by other widely varying products.

Marbille plaster is employed on several exhibition walls—in itself a witness of its merits—and particularly on the walls of the sole London agents, Messrs. A. W. Green & Co. The plaster is made in five grades from a pure gypsum stone by a special process. Quick interior and exterior work is possible with it. The second coat may be laid on the first within a few hours, and the most delicate decoration can

be applied forty-eight hours later. Its cheapness is put forward as another point.

Messrs. Wm. Griffiths & Co., Ltd., in addition to displaying Norway and Guernsey pitchings and Belgian and Guernsey granite, have set up specimens of "Opalite" tiling suitable for lining walls of subways, bath-rooms, &c., with a curved frieze made up of the opalescent tiles. The combination is most pleasant. Messrs. Griffiths are ready to supply and fix "Opalite" which does not crack or craze.

Though mosaicwork is of very ancient date it is still possible for new ideas to be brought to bear upon it. English glass mosaic, recently placed upon the market by W. G. Crotch & Son, Norwich, is one. The insuperable obstacle to a general employment of this striking form of decoration is its great cost. Any cheapening process should be welcomed with applause. The company claims to have reduced the cost 40 to 50 per cent. below the old style. Its appearance may be judged at the handsome stall of Clark & Co., the exterior of which is made of Reconstructed Stone. A small dome has been set up in the roof and filled with glass mosaic with circular designs. Mosaic under its new form may be employed in many other ways like shop frontages, trade signs, permanent posters, &c., which would be certain to attract notice and so serve as an advertisement. Messrs. W. G. Crotch named their other material "reconstructed stone" because in every respect it differs entirely from the ordinary artificial manufacture. In one test a block was soaked in water for rather more than twenty-four hours. It was then kept for six days completely surrounded by ice; it was immediately afterwards placed in an incubator at 100 deg. Fahr. and finally baked in an oven at 300 deg. Fahr. The block was found to have retained its surface, texture and resistance to flaking, &c. Nothing further need be said as to its weathering qualities. The interior wall shows Xeleste quick-setting plaster, which is manufactured by Cafferater & Co., Newark-on-Trent, and sold by Clark & Co. The plaster has been used on all descriptions of buildings in this country and in America. One of its many advantages is that one material only is required, mixed with sand for rendering, and used next for finishing.

HIGHEST AWARDS at all INTERNATIONAL EXHIBITIONS.

Whether you wish to paint your bath, your house, your motor or your yacht, *Ripolin, Ltd.*, are anxious to help you both with their advice and their material. It is further used by railway companies for the protection of their signals, rolling stock, bridges and hotels. It would be difficult to exhibit instances of each of these objects in the sixty-eight available tints, so the company show an interior representing a room designed in Empire style with a pleasing colour scheme of Wedgwood green, white and blue. Ripolin has been the brilliant rival of wall-papers for more than a quarter of a century, and mental comparisons between the two may be drawn at the stand. The distinctive qualities on which most stress is laid are the durable, smooth finish and pure and permanent colours. There is the Ripolin gloss and the Ripolin flat. The following is an alluring scheme suggested by the firm:—A cool mossy green dining-room, a rose du Barri drawing-room, cosy red staircases, delicate Wedgwood blue bedroom, spare room of French grey, and bath-room and kitchen of pure white.

The "Paragon" is a very recent addition by *Messrs. Colthurst, Symons & Co., Ltd.*, to the numerous patent tiles on the market, and has for object the exclusion of all rain. The right edge of each tile is raised and grooved so as to fit into a groove on the left edge of the next tile. Battens laid to 12½ gauge; at this gauge it takes 120 tiles to the square, and the weight is 5 cwts. Several other of their patent tiles are shown, such as an interlocking Roman tile, which has a similar principle to the "Paragon." They are made to bond, and so securely interlock as to remove any necessity of nailing. The "Acme" tile is recommended for villas.

Messrs. Norton & Gregory have long been rendering invaluable aid to architects, engineers and builders. "Velo-graphy" is recommended for the reproduction of plans and drawings for its speed, accuracy, permanence, manipulation, variety of material, drawings copied direct, and price. But their aid is likewise brought inside the office. There is the improved "Perfect" drawing-table with T-square or straight edge attached; the compact "Perfect" drawing cabinet, one of which, though only 20 inches in depth, is capable of holding 300 or 400 drawings; the "Arcus" sun printing frame; a large selection of instruments, and picture frames for the ultimate fruits of all their help.

In the "Bond" fire of *Messrs. Wilmer & Sons* 3-inch firebrick slab is placed some 3 inches below floor level. A bright steel hearth slope fits in the grate so made. The coals rest on a specially constructed grate almost on a line with the floor. In consequence the heat radiates along it and drives the cold air up the chimney.

useful accessory can be supplied when the fire is built against an exterior wall; a cast-iron box fitted behind the stove communicates by a pipe with the outer air. The cold air enters, passes through the box where it becomes warmed and escapes through a pipe above, which terminates in a ventilator fixed in the wall of the room overhead. This arrangement has proved most satisfactory.

THE

Building Trade

If not send 1d. in stamps to
P. A. GILBERT WOOD,
6-11 Imperial Buildings,
Ludgate Circus, London.

Among the new exhibitors is the *Berkefeld Filter Company, Ltd.*, with a very interesting display of their well-known filters. These are now made in such a variety of forms that they can be used for practically any purpose. They are simple in construction and can easily be cleaned, and it is claimed they yield a sterile filtrate five to ten times larger than other germ-proof filters. A very convenient form for household use is the "Berkefeld H" pressure filter, which is attached to the main service pipe by a cistern where there is a fall of not less than 10 feet, and yields a constant supply of germ-free water, which is obtained by simply turning on the tap.

Dr. Sims Woodhead, F.R.S.E., said of this filter:—"The rate of filtration is very rapid; in fact, the output is so large that there is no reason why such filters should not supply sufficient water to meet all household requirements." This pattern filter, and the larger sizes, has been used in innumerable private houses, hospitals, hotels, rail-trains, &c., and two nickel-plated H filters have been carried to the Royal yacht for the present Mediterranean cruise.

The house-pump filters, drip filters, &c., are for use where no pressure is available. They are also exhibiting "Winco" semi-rotary wing pumps, a handy appliance for lifting and forcing water. These pumps consist of a perfectly cylindrical casing, in which a strong brass wing, provided with valves oscillates, and while principally operated by hand, they can easily be adapted to horse, steam, or wind power. They are very compact, and can be easily fixed and removed. There are thirteen sizes supplied in iron and brass, or in all brass, as well as double and quadruple acting. The approximate capacity is from 10 to 7,000 gallons.

The boilers of *Messrs. Hartley & Sugden* appeal to all who can appreciate the merits of a boiler. They show the "White Rose," the "Saville," the "Climax" and other types. The "White Rose," series A, was introduced about 25 years ago; this cast-iron sectional boiler met with instantaneous success, and was supplemented by series B and C, &c. Series F is a small pattern specially adaptable for small installations like motor houses. The firm are makers of both wrought-iron and cast-iron heating apparatus. Their display must increase their reputation still further.

Messrs. Samuel Elliott & Sons, Ltd., of Caversham, Reading, have an imposing display of their well-known joinery. Possible sceptics will be reassured by the statement that the work is not faked or especially produced for this exhibition, but is part of the orders at present in hand. In the centre of the principal side of the stand is a large Austrian oak hand-carved mantelpiece. As in all the other pieces, it is a pleasure to feel the smooth-cut surface and to see the sharp carving. A highly polished door of curly pitch pine hung up has seen four years' service. If it were not for the printed announcement it would be taken to have been just despatched from the Caversham works. Elliott's patent simplex weather bar for casements opening inwards has been introduced throughout the New Scotland Yard and the Imperial Institute. The chief feature of its utility is that it can be applied most readily to existing casements, it is a perfect preventive of the ingress of wet and draught, cannot get out of order and can be fixed by any workman. Mr. John Belcher, A.R.A., had the weather bars tested by forcing water against them through a hand-pump, and although the casements open inwards, "there was not a sign of water or moisture anywhere internally. In fact, they appear to be quite weather-proof and a great success."

Compoboard for walls and ceilings is shown by *Messrs. Machin & Koenig*. It is made of thoroughly seasoned wooden slats 4 feet long and about 1 inch wide, joined in an endless web, so that the 4-foot length of the slat forms the width of the complete board, while the length may be from 1 foot to 18 feet. It is said to be a little cheaper, and must certainly be very much quicker to put up than the ordinary lath and plaster. Consequently when speed is a desideratum this material is invaluable. *Messrs. Machin & Koenig* show several panels in ornamental woods.

D. G. Somerville & Co.'s stand is made up of a reduced replica of the upper portion of a steel-framed telephone building with reinforced concrete, sound and fire-resisting floors and roof, as supplied and erected by them for that and many other contracts. They offer two alternative flooring systems: one consists of steel joists, combined with their hollow reinforced concrete tiles (of which the total weight, exclusive of top finishing, is 35 lbs. per foot super.); the other reinforced concrete beams, instead of R.S.

THE WELL FIRE CO., LTD.,

33 Dover St., Piccadilly, W.

SOLE MAKERS:

Bowes' "WELL" FIRE
Patent

AND . . .

"PYRAMID" FIRE.

THE "PYRAMID" GRATE has a FALSE HEARTH, fixed or movable, the upper side of which is a slab of firebrick upon which the hot ashes fall. This forms a regenerative hot-air chamber under the bars, and secures perfect action and **GREAT ECONOMY**. The underside is formed of cast-iron, and being raised above the ordinary Tile or Stone hearth, it forms a cold-air chamber, and **PREVENTS THE POSSIBILITY** of any unexposed timber under the hearth **BEING IGNITED**. This is a real danger arising from the use of most low types of grates which have not this protection.

PATENTEES & SOLE MAKERS:

THE WELL FIRE CO., Ltd.,

33 Dover Street, Piccadilly, W.

Also LIVERPOOL, MANCHESTER, GLASGOW,
EDINBURGH, LEEDS, DARLINGTON.

THE "PYRAMID" GRATE (Patent).
NEW PRICE LIST ON APPLICATION.

joist bearers; the weight of this complete (including steel reinforcing bars and concrete, but exclusive of top finishing) is 45 lbs. per foot super. A section of a concrete pile as supplied and used by them in the reconstruction of the Town Quay, Southampton, is given. It consists of reinforced concrete slabs fixed round angle-iron guides, and with ordinary concrete filling.

The wide range to which the *Cloisonné Glass Company* can put their material is shown at their stall. As glazing for windows and doors it has become quite familiar. It is no less applicable for lamps, screens, transparent mosaics and facias in different styles of lettering. The goods are all marked as to price, and should find an extensive sale during the fortnight they are shown. The swinging lamps give an alluring effect to the interior, where there are trays, mahogany frames and tables, &c., ornamented with cloisonné panels, to delight everyone.

The buff terra-cotta building and paving bricks and roofing tiles of *Messrs. Towers & Williamson* afford a pleasant change from the more usual colours. Their appearance is solely due to the natural clay, and in no way to adulteration or faking. The tiles are made in four shades, a combination of which gives great variety to a roof.

The "*Safety*" *Water Elevator Company* continue to win friends through their patent appliance, which must be a boon and a blessing where a water supply is not laid on and resort has to be made to primitive wells. It insures perfect protection for the water.

Messrs. R. Gay & Co., Ltd., can boast of the distinction that their impenetrable paint is the only paint used on the lifeboats of the Royal National Lifeboat Institution. *The Architect* said, in 1870, "The impenetrable paint of Messrs. R. Gay & Co. has had the test of time, and its qualifications are numerous." This may be said with still greater truth nearly forty years later. Their Etruscan paint as used on Buckingham Palace is a cheaper brand of ready mixed paint and is adapted for all outside work, is anti-corrosive and dries hard in eight hours.

Carl Flohr, in addition to exhibiting a model of his patent electric push-button lift, now offers two new electric machines, one being for drilling and the other for rivetting, to the notice of structural iron engineers, &c. Each is portable and entirely self-contained. The drilling machine

can be suspended from the overhead track or beam so as to work vertically, horizontally, or at an angle. The rivet machine does its work in about a second by the manipulation of an ordinary bell button.

Messrs. Hopkins & Co. are showing at the stand of *G. M. Callender & Co., Ltd.*, a specimen of their unglazed slab name-plates intended for streets and direct posts. The black lettering shows up against the white background, and the plates are both strong and durable.

Messrs. Vickers & Field, Ltd., show their patent "Wirebit," which consists of pure Trinidad lake bitumen spread on woven steel wire; the meshes form a mat to hold material and keep it in place under superincumbent pressure. A small tank lined with "Wirebit" is filled with water and proves its watertightness as a damp-course. It is sold in rolls 18 feet and 24 feet long, and of any width desired. The material conforms with the building by-laws of district councils and local authorities. As a roofing material it has proved useful.

Brookes, Ltd., make a display with granite from Norway and Sweden. They manufacture artificial stone flags and bricks and tiles at their new works, Broad Oak, Hipsleyholme, near Halifax. *Joseph Brooke & Sons* have supplied during the past twenty-five years many of the large building contracts with Silex hard York stone for steps, landings, &c. The *Hard York Non-slip Stone Company* employ their stone for decorative work, in addition to its original form of paving.

Mr. John Tann has an excellent exhibit at Stand No. 1 of "Anchor Reliance" safes, strong-room and party-wardens. The safes are bent solid at all twelve corners, rendering them proof against injury through falling from any height. From his long experience, being one of the originators of fire and burglar-proof safes, the latest models combine the best workmanship and methods with the maximum of security.

The catering is being most satisfactorily carried out by *Messrs. Lyons & Co.*, but the ventilation of the rooms set apart for the comfort of visitors and unfortunate attendants at the exhibition is very far from satisfactory. In our next issue we shall give further particulars of the many exhibits to which want of space this week has prohibited our referring.

WARING'S

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief, as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. Gill, town clerk, Town Hall, Birkenhead.

LONDON.—The Metropolitan Borough of Bethnal Green invite designs for new municipal offices, Council hall and committee-rooms. Premiums of 100l. and 50l. Conditions and plans from Mr. G. E. Finch, borough engineer, Town Hall, Church Row, Bethnal Green, on payment of 2l. 2s., returnable on receipt of design.

CONTRACTS OPEN.

The Building Trades Exhibition, Olympia.

ALL roads appear to have been leading to Olympia during the past fortnight. The great building can absorb an enormous number of people without suggesting a crowd. Nevertheless there have been many times when it was impossible to make one's way in comfort among the stalls. A genuine interest in what is shown is manifested by the majority of visitors, who usually appear connected directly or indirectly with the building trades. Perhaps we might include under this head the Prince and Princess of Wales, who spent some two hours in making a tour round the building. They, like many others, found attraction in the collection of loan drawings displayed in the annexe by the proprietors of *The Architect*. Mr. P. A. Gilbert Wood, the managing director of *The Architect*, was in attendance, and was called upon to answer questions relative to them asked by their Royal Highnesses, who afterwards made use of the temporarily installed Waygood's lift in ascending to the gallery, under the direction of the chairman, Mr. Henry P. Walker, and Mr. D. W. R. Green. His Royal Highness referred to the lifts erected by Messrs. Waygood in Marlborough House in commendatory terms. The Prince's request to be shown some New Zealand timber was gratified by Messrs. Oliver & Sons, Ltd., who have their stand in the centre of the hall.

The view we give will indicate the business-like appearance of Olympia during this highly-successful exhibition, as seen from the gallery.

The Swansea Stone Block and Machine Company are the sole agents in this country for the Pettyjohn system. As might be expected, it comes from the United States, where hollow concrete blocks have been established some years. In this case the concrete is rammed into the machine in a half-dry state; when this is done the cores are taken out and then the whole machine removed to form the next block. By this process twenty can be made in an hour. There are no cogs, springs or levers to get clogged by the cement. It is said to be possible to erect a six-room house and render it fit for habitation in less than four weeks, at a cost of about 150*l*. Application has been made to the authorities to allow 175 workmen's cottages on the Pantygwyr estate to be built with hollow concrete blocks.

Messrs. T. C. Fawcett, Ltd., have at work a new patent multiple-roller wirecut brickmaking machine, which will make either 8,000 or 25,000 bricks per day by simply varying the speed of the driving pulley, it only requires 8 horsepower to drive. It consists of three pairs of rollers of different diameter, but each 10 inches wide. The clay space between the first pair is 1 inch, between the second pair 3 inches and between the third 5 inches. A feed roller is placed in the hopper of machine. The clay passed through the first pair of rollers expands into the space between first and second pair. It then passes along in a column 3 inches thick to the space between second and third pair of rollers, the latter of which forces the column 5 inches thick through a die of the required size of brick. The internal friction is thus reduced to a minimum, the whole pressure of clay coming directly on to the mould. It will make special shape bricks, perforated bricks, drain-pipes or flooring tiles as desired. Messrs. Fawcett exhibit other appliances for brickmakers, such as a self-starting power cutting table, a power safety brick and tile press and a duplex portable press.

The Bexhill Casement Window Company have done away with pulleys, sash-cords, weights and rattling, and other evils under which the householder has been silently or loudly groaning, according to his temperament, for so many years. The company promise the new generation that driving rain or howling wind shall no longer force its way into rooms as heretofore. The full-size models exhibited inspire confidence that a great advance has been made towards affording an escape from the old shortcomings of sash-windows. Domestic servants have to be considered at the present time, and the "Bexhill" window cannot fail to win their warm approval for its safety in cleaning. The occupants of a room will no less appreciate it. When a big wind is blowing from one side the window can be made to act as a screen, leaving part of the frame open on the other. The window is formed of two sashes, hinged in the centre. To open it all that is necessary is to lift the catch, throw back the lever of the lock and then press outwards on the centre of the sash. The extreme sides reverse the runners and come towards one another, making

a V-shaped window with the point outwards, and leaving a free space on each side; or one side of the window may be left fitted into the frame and the other brought up to it, leaving nearly the entire window without any impediment to the ingress of air. In either case the two sashes can be firmly locked at any point along the entire length of frame. Every part of the glass can be reached for cleaning purposes from the inside of the room.

There is something of an *embarras de richesses* about the stall of Messrs. Nettlefold & Sons, Ltd. Their stand shows the new "Coburn" overhead trolley track as used in moving heavy weights about warehouses, &c., and also new and elaborate designs for door handles. Between these two extremes comes much else to interest architects, engineers and builders. Messrs. Nettlefold have acquired the assignment of all the British patents of the "Bardsley" oil door check and spring, and checking springs, &c., so that these will in future be of English workmanship. The door check is noteworthy for the fact that it may be applied to either hand or either side of a door without any change, and that no packing is used. Specially prepared oil is used as a checking medium. Their sliding doors and sliding collapsible partitions hang clear from the ground. The general ironmongery shown is worthy of the reputation of the company. The door furniture ranges in style from Mediæval to l'Art Nouveau. They are the sole agents in the United Kingdom of the Bullard patent automatic pipe wrench, which is worked by hand. When applied it opens instantly and closes itself till it grips, which it does without crushing.

John Whitehead & Co., Ltd., manufacturers of brick, tile, pipe and clay preparing machinery, have brought to Olympia a patent multiple edge runner mill for grinding clays, shales, &c., so thoroughly that it can pass immediately to the brick-making machine. It is built in three sizes, and may be constructed for either wet or dry grinding. The improvements claimed for it are greater crushing area and economy in space required. Material is gradually reduced and more thoroughly ground, for it is operated on by the six runners. By economy of motive power and labour the wear and tear is reduced to a minimum.

The display of wall-papers made by Arthur Sanderson & Sons, Ltd., will probably have the effect of stimulating

the seasonable fashion of having houses "done up." Particular importance appears to be attached by them to the proper blending of the friezes with the paper. The frieze affords the greatest scope for originality, and at the stand there are many pleasing designs. Some of them are veritable pictures—as the Rillington Hunt frieze, which would inspire any young mind with a longing for the chase; others are more purely decorative.

Mr. Mark Gentry devotes one side of his stall to the red and ornamental bricks which he manufactures at Sible Hedingham, in Essex, and the other to displaying the products of the Pioneer Glazed Brick Company, of which he is the London representative. The letters Pioneer on the top are in white glaze with brown as a background and stand out with great prominence.

Jabez Thompson & Sons, Ltd., are manufacturers of terra-cotta in numerous forms. Their stand was designed so as to suggest its architectural possibilities. Terra-cotta may be obtained glazed or unglazed, vitreous or plain, in grey, pink, red, buff, salmon-buff or other colour as desired. Their patent "Terrawode" brickwood for partition walls is a very porous earthenware, about half the weight of ordinary bricks or concrete, averaging 50 lbs. to the square foot. Nevertheless, a Kirkaldy test proved that the crushing strain on six "Terrawode" blocks 9 inches by 4½ inches by 3 inches was 1,526 lbs. per square inch or 100 tons per square foot. The British Fire Prevention Committee demonstrated its qualities in another direction. The material withstood a four hours' test up to 2,100 degs. Fahr., and then for five minutes a steam fire-engine played water upon the partition. It is sound-proof. Nails can be driven in without difficulty and it can be sawn. The "Terrawode" patent thin partition is made of slabs of the brickwood, averaging 12 inches by 12 inches by 2 inches or 3 inches thick. These are tongued and grooved on two edges, and are square on the remaining edges. The partition is so constructed that in every groove the tongue of the upper slab rests embedded in mortar, and when the partition is plastered on both sides, the whole combination of slabs unite, and become a firm stiff mass. Brickwood is supplied as circular blocks or square slabs for the protection of steel or ironwork. After two and a half hours' test by the Fire Prevention Com-

ittee, when the temperature was nearly 2,000 degrees
hr., all the steel stanchions so protected were in position
the removal of encasement and found to be unaffected.
their patent floor is constructed without the use of concrete.
"Terra-wode" is made to serve numerous special and
important purposes.

Last week we were only able to make a hurried allusion
Xelite plaster, and unfortunately it was misleading in
the important respects. *Clark & Co.* have placed on the
market a slow-setting English made hard plaster to rival
Cene's or Parian cement. Large gaugings can be made
a time, so that a workman may prepare in the morning
efficient to last him throughout the day. Water float-
ing improves rather than injures the wall. There is no
aste, as all the droppings and remnants can be tempered
and used. The rendering hardens gradually and increases
strength. The finish is remarkable for hardness and
flexibility.

John Yates & Co., Ltd., have a representative collection
of tools for contractors, and public authority use, including
their well-known "Bull" brand shovels, picks, spades,
rafting tools, road wedges, crow-bars, hammers, &c. They
so exhibited their new road danger lamps, which they
have recently put on the market, and illustrations of their
approved rotary screen.

Messrs. Machin & Koenig have supplemented their
exhibit of compoboard and panelling by E.T. slabs, or extra-
light slabs, of asbestos cement. They seem to be proof
against all the enemies of building, whether it be fire,
damp atmosphere, rot or vermin. The triple virtues are
great size, strength and cheapness. The slabs can be
worked by ordinary carpenter's tools, and may be painted
after a coat of priming, papered or distempered immediately
after fixing, which is done with galvanised steel nails.

Messrs. Lewis & Co. apply a patent flexible mastic
asphalte to damp-courses, roofing-felt and slaters' felt. In its
manufacture a chemical process is employed so as to make
the substance very highly compressed. Their felt is largely
used for roof covering, sheds, outhouses and barns; it is
also used under galvanised sheeting, slabs or tiles, &c.
Should a portion of the tiles accidentally become defective
it would still be sufficient covering.

Maughan's Patent Geyser Co., Ltd., intend the "Gacylote"
automatic cylinder for general house supply. To warm
15 gallons of water to 140 degrees it uses 20 feet of gas.
To maintain it at that temperature the supply is auto-
matically reduced to 3 feet. When hot water is drawn off
and cold water enters the geyser the gas supply again turns
on fully, until the water is heated to 140 degrees again.
The "Finsbury" circulating boiler is a similar principle on
a reduced scale. Their "New Teb" and other geysers are
en évidence.

The feat of making one fire stand in two rooms sepa-
rated by a solid brick wall has just been achieved by
Messrs. E. & C. Braby. This is no illusion, but is worked
by means of their patent revolving stove. The circular
stove is placed in two back-to-back chimneys, and is divided
by firebricks. One-half is lighted, and when the first room
is warmed a bolt is raised and the fire swings into the other
grate behind. The firm show a few of their wood mantel-
pieces, steel hob and dog grates and iron mantel registers.
The visitor would be more than hard to please who could
not find something to win his admiration.

The London Building Acts (Amendment) Act, which
came into operation last year, ordains under section 12 that
all trapdoors shall be made to open automatically. To meet
this requirement, the "Bafeco" fire escape was put on the
market by the *Building Acts Fire Escape Company*, and has
received the approval of every district surveyor in London.
It is the patent invention of Mr. E. J. Sadgrove, the archi-
tect. At the stand of Messrs. J. A. King & Co. there are a
number of models that show the apparatus fitted under
different conditions. In one the apparatus raises and
lowers the ladder as well as the roof-trap and ceiling-trap;
another is without the ceiling-trap, a third has a fixed ladder
with only the outer trap in operation, and a fourth shows
how the trap-door and ladder in a flat roof are worked. A

CAXTON HOUSE, WESTMINSTER.**

full-size trap-door (fitted as in use) demonstrated the infinitesimal exertion needed to open this trap-door; a slight pull on a handle releases the locking catch (which prevents the trap-door being opened by unwelcome visitors on the roof), and the trap-door opens silently and easily—very little exertion was needed to close it again. At the same stand we see common clay or gault bricks transmogrified into high-class glazed bricks with an impermeable surface. The

sample bricks on view are ordinary building bricks from well-known brickfields near London, and they are glazed with a pure white impermeable glaze which will neither crack, craze nor fly, and is unaffected by the atmosphere—it is unstainable and will always remain white. They triumphantly withstand a rigorous ink test.

A tasteful pavilion, designed by Mr. R. F. Atkinson, has been erected to display the bricks of *C. H. Norris, Ltd.* The quiet charm is due in no small measure to the broken colouring of the brickwork. The "C. H. N. mark" of red hand-made sand-faced brick are manufactured in three shades—light, medium and dark. It is roofed in "Precelly" slates, likewise of various tints.

The Frazzi fire-resisting floors, ceilings, roofs and partitions are shown by the *Frazzi Fireproof Construction, Ltd.*, at the stall of A. W. Green & Co. The partitions are of three-inch blocks, which is a thinness prohibited by most by-laws. However, in some happy spots which are untrammelled by out of-date Acts, we find houses, hospitals and churches erected with them, and the results have been most satisfactory. In certain towns they have been

approved for use on temporary buildings. The Windso authorities are negotiating with the Local Government Board for such modification of the by-laws as would permit the unrestrained use of Frazzi partitions. Frazzi ware is a fine porous terra-cotta made at Cremona, Italy. Its lightness is suggested by the fact that the "Excelsior" partition two and a quarter inches thick, weighs seven pounds to the square foot. They may be built upon the ordinary floors of a building without any special provision for supporting them, and no fixing to walls or ceilings is necessary. Messrs. D. Kirkaldy & Son carried out tests in 1902, and the results proved the great strength of the material. In a test at Cremona couple curved slabs, having a span of 8 feet 6 inches and a rise of 8 inches, the load per square foot was $8\frac{1}{2}$ cwt. For ceiling and roofwork there are straight curved and slightly curved slabs, ceiling slabs and roofing slabs. There are many ways of using them under varying circumstances. In one type the floor is composed of three parts, the joist covers (specially designed for the purpose), the straight slabs 3 inches thick and the ceiling slabs, which may be the hollow slabs $1\frac{1}{8}$ inch thick, or the ribbed slabs $\frac{5}{8}$ inch thick. The upper surface is nearly flush with the joist flange, and the lower surface forms a flat ceiling suitable for plastering. Between the floor and ceiling slabs an air-chamber is formed. It is sound-proof, and is particularly suitable for receiving wood-block or parquet flooring. No centring is required in its construction. The hollow spaces are of great value for carrying gas or electrical mains, and may be used also for ventilation if desired. Frazzi is used for girder and stanchion casings and conduits for electrical cables.

The unostentatious architectural character of the stall of the *Lithographic Stone and Marble Company, Ltd.*, and the *British Building Stone Company, Ltd.*, makes it conspicuous. Its impressiveness is increased rather than diminished after hearing an explanation of the processes to which the stone and marble have been subjected before they arrived at Olympia. It appears that blast-furnace slag has for these nineteen centuries been under a cloud, and it has only now received its due. By the new process the slag is really marble—Connemara green, Rosso Antico, Broccatella, Sienna, Egyptian porphyry, light Cippolino and even lapis

all— all these and other marbles and stones are waiting use in a heap of furnace slag. Building stones are ned out in a similar manner. As recently as October 12, 1906, we described the process of manufacture, so we ill not repeat our account. The company claim to b in a position to reduce the cost to the building er by at least 25 per cent. In anticipation of the and which they confidently anticipate the company is e enlarged so as to increase their output tenfold.

"The Only" is a name given to Grundy's patents, which sold by the *Sanitary Appliances Syndicate, Ltd.*, and it is l of them that they are "the only fittings which conform modern ideals of sanitary science." A specialty is made school equipment. It is out of the question, owing to limitations as to space, for us to comment in detail on appliances with which the syndicate advance the cause public health. They fill no less than five pages of the ibition catalogue, and comprise patent silent closets, is, gullies, anti-flood and other valves, cisterns, &c. All designated as "The Only," and we have suggested ve the high standard which the company have set up.

The "Notlor" patent chimney-stack cappings are so e-structed that the different parts when bedded and jointed, o having lime concrete poured in holes made for the e- pose and well grouted, are bonded and held strongly e-ther, forming one solid capping over whole of stack, eaving only openings of required size for cementing in g-ots of chimney-pot seatings and flanchings. *Messrs. eley & Taylor* make patent chimney-pots, which are self- ing, detachable and interchangeable.

The "Devon" fire can have made few enemies during its eer. But we venture to suspect that *Messrs. Candy & Co., Ltd.*, the makers, are cordially disliked by a small ugh influential body—we mean colliery proprietors and e-eholders, who see a menace to their profits. Our eaders may remember that joint tests were carried out last ur by the Office of Works and the Coal Smoke Abatement e-ety, under the direction of Sir Henry Tanner, at the e- Government offices, Westminster. During the thirty- e- hours the "Devon" fire consumed 20.43 lbs. of coal, e- less than two-thirds of a pound per hour; while the e-er thirty-six competing grates had an average total on- e-ption of 27.92 lbs., which is an increase of over 25 per

cent. Nevertheless the heat of the "Devon" was nearly 4 per cent. higher, and the smoke produced was 25 per cent. less. *Messrs. Candy & Co.*, with two other firms, were bracketed as first in the test. In the "Devon" fire the coals are placed direct into the sunken slab, and there are no air holes, sufficient draught coming from the top. This peculiarity leads to no difficulty in lighting; the fire may either be laid in the customary way or a little coal may be placed as a foundation layer under the paper. *Messrs. Candy* have always in stock a large variety of designs which are suitable for any description of room. They are in addition showing glazed terra-cotta bricks of many kinds, tiles and much else.

The *Hard York Nonslip Stone Company* have an excellent show of their nonslip stone, applied to both architectural work and paving work. The stone is very pleasing in colour and texture, and as it is made solely from crushed "silex" stone its life and wear are beyond dispute. The special feature of this stone for pavements and mosaics is the fact that it never becomes slippery in wear, and is therefore a very "safe" stone for paving. We commend it to the notice of all interested in paving work.

Anyone contemplating the use of "improved cork pavement" must see the samples shown by *Cork Asphalte, Ltd.*, the sole manufacturers. It is a compound consisting principally of bitumen and cork, and is made for use in court-yards, stables, mews, &c., in homogeneous blocks of uniform size. The three adjectives claimed are non-absorbent, non-slipping and noiseless. Durability is another quality, of which many convincing proofs are available. Twelve years ago it was laid in Tattersall's sale yard and the east suburban entrance of the Great Eastern Railway station, eleven years ago in the L.C.C. stables at Lambeth. Photos taken in 1906 tell that the surfaces have survived wonderfully the severe test. In 1898 it was laid in the Royal Mews, Buckingham Palace; in 1902 one of the officials wrote, "We have been anxiously waiting for centre of mews to be laid with it." In the same year it was put down at Windsor Castle, with "excellent results," to use the phrase of H.M. Office of Works. It is recommended for stair treads.

The *Gilmour Door Company, Ltd.*, might appeal to the public for attention on Imperial grounds, for they originate from Canada. Presumably they are confident of being

Brilliant

Letters, Brilliant Facias and Signs of every description go to the Original Patentees and Manufacturers and **save at least 20%** while securing the highest grade work, instead of the inferior imitations.

strong enough to dispense with such an incidental merit, and prefer to let the doors speak for themselves. Their aim was to build the hardwood doors in such a way as to exclude all possibility of warping, twisting, splitting or blistering, and to render the made-up (say oak) doors equal to the vastly more expensive solid oak doors. Taking the construction of oak doors as typical of the other hardwoods, we might say there is a corrugated oak facing with a core of another wood laid in blocks giving a cross grain. The end of the door is solid oak to about an inch so as to allow of any planing. The panels are five ply, likewise so built as to give an alternating grain and with an oak facing of the same or another wood. The entire door is brought together under great pressure. Their hospital doors (of which 180 have been fitted at University College Hospital) are made with an absolutely flush surface both sides and on a similar scientific principle.

Messrs. Joseph Brookes & Sons, of Hipperholme, Halifax, are exhibiting their noted "silex" stone, a very fine grained natural York stone, specially suitable for steps, landings, pavings, &c. This stone is quarried at a depth of 80 to 90 feet below the surface, and is of such a nature that it will withstand a crushing strain of over 17,000 lbs. per square inch. The stone has been used for many years by H.M. Office of Works and many leading architects, and amongst the recent works carried out may be mentioned the following:—The new War Office, Local Government Offices, Admiralty Buildings, Royal College of Science, extensions to British Museum, &c., in all of which the staircases throughout have been built in this stone. The exhibit includes a few steps for a winding staircase at the British Museum and also steps for the new Public Offices. The finish and masonry of these leave nothing to be desired.

The 15-feet high Austrian oak corner pillars on the stand of *Hofler, Ltd.*, direct immediate attention to their high-class woodwork, which comes from their large factory near Vienna. The firm's art metalwork, however, is produced entirely in London, a fact which may be noted with some pride. For if the woodwork and carving are excellent the other is no less so. Part of the stand is laid with "Durato" flooring in which asbestos largely enters, and which is described as nearly as cheap as linoleum, almost as durable as granite. There are in addition rolls of their

patent asphalted sheet lead damp-course, of which during nineteen years more than ten million yards super have been laid. It consists of a continuous perfectly non-porous foil of lead embedded between two fibrous asphalted layers. Special thicknesses of lead foil are obtainable.

Messrs. Benham & Sons, Ltd., supply a class of goods which is as indispensable to most buildings as bricks and mortar. Indeed, of recent years houses have been built without bricks or tiles, whereas ever increased attention is bestowed on cooking apparatus. Consequently, no builder or architect should neglect to see the present-day apparatus whatever else they may wish to pass over as being of fleeting importance. Anyone who has to make arrangements for fitting up kitchens where cooking is to be done on a large scale should carefully examine the central hot plate shown. It is made of wrought-steel, as this material has proved far more durable than those made of cast-iron. Very heavy metal is employed throughout. There are three ovens and two fires on each side, with a steam-heated closet and hot and cold-water supply, and a plate rack is placed on the top. Their patent "Wigmore" kitchener has a perfect roasting fire, enclosed by folding screen doors and vertical bars, two good ovens, a serviceable hot plate with heavy metal, tiled or cast-iron coverings, and a plate rack (which can be closed by doors, forming hot closet) extending the whole width of kitchener. It is made in all sizes up to 24 feet. Further culinary equipment is seen in a three compartment steam oven, a hot closet or plate warmer, a charcoal and a gas grille, and a "Wigmore" independent boiler and cylinder.

The Cavity Ventilating Building Block Syndicate, Ltd., show their novel system on the stand of Messrs. Sutcliffe, Speakman & Co., Ltd. In the manufacture of the patent blocks almost any material can be used, such as cement, gravel, stone, slate debris, burnt ballast, dust destructor refuse, mine tailings, &c. They are made for 6-inch, 9-inch, 14½-inch and 18-inch walls and upwards. In construction the exterior walls consist of two separate blocks, spaced about 1½ inches apart and bound together by a concrete dowel which gives them the rigidity of solid walls and the advantages of hollow ones. The cavities are so constructed that the buildings are ventilated both horizontally and vertically.

THE WELL FIRE CO., LTD.

THE "PYRAMID" GRATE (Patent).
NEW PRICE LIST ON APPLICATION.

33 Dover St., Piccadilly, W.

SOLE MAKERS:

Bowes' "WELL" FIRE
Patent

AND

"PYRAMID" FIRE

THE "PYRAMID" GRATE has a FALSE HEARTH fixed or movable, the upper side of which is a slab of firebrick upon which the hot ashes fall. This forms a regenerative hot-air chamber under the bars, and secures perfect action and **GREAT ECONOMY**. The underside is formed of cast-iron, and being raised above the ordinary Tile or Stone hearth, it forms a cold-air chamber, and **PREVENTS THE POSSIBILITY** of an unexposed timber under the hearth **BEING IGNITED**. This is a real danger arising from the use of most low types of grate which have not this protection.

PATENTEES & SOLE MAKERS:

THE WELL FIRE CO., Ltd.

33 Dover Street, Piccadilly, W.

Also LIVERPOOL, MANCHESTER, GLASGOW,
EDINBURGH, LEEDS, DARLINGTON.

between floor joists. The company have turned to practical use the lessons taught at the 150^l. cottage competition at Letchworth, and their five-roomed villa combines the points of the prize cottage and the recommendations of the National Housing Reform Council. They are prepared to take contracts to erect cottages for that figure. The whole system is based on standardisation. The interior partitions are the same principle line up with the outside walls. The faces can be coated and then highly pressed so as to show marble or mosaic, or anything of that kind. The company are ready to hire out the specially-prepared plant for the purpose of manufacturing these blocks on the ground of proposed building sites ripe for development, also to the owners of granite and other quarries or works where the use can be utilised in the manufacture of the cavity ventilating building blocks, flagstones, tiles, &c.

Messrs. Brookes, Ltd., of Halifax, London and Manchester, are making a special show of the granite productions from their extensive quarries in Norway, Sweden and Guernsey, and the samples shown are very interesting. The architectural work from Ystehede quarry proves clearly that the rock is of a specially fine quality, and the workmanship is not lacking in any respect. In setts and macadam, specimens from Norway and Guernsey are shown, and we think, generally speaking, surveyors and engineers will find that this exhibit is worthy of special attention.

The "Kulm" patent fireproof partitions are made by W. Cullum & Co. in slabs 42 inches long by 11 inches wide and from 2 inches to 4 inches in thickness. Their principal aggregates are volcanic sand and pumice, with Portland cement to bind them. Their introduction where heavy loads have to be carried is not advisable unless other means of support are provided, as might be expected from their great lightness, being 75 per cent. less than brickwork. They have been used in the construction or alteration of many London theatres, clubs, railway stations, hotels, &c. On the same stand there is hung a coil of wire rope made by the Bristol Wire Rope Co., who are the inventors and sole manufacturers of patent ladder grips and improved galvanised flexible steel wire scaffold lashes, &c. The conspicuous coil exhibited should receive more than a momentary glance from passing contractors. It is something that directly concerns them.

The Baumann blinds can act as Venetian blinds or sun blinds or shutters, to suit the exigencies of the moment. They are made of thin white or red pine laths, cut obliquely and fastened to metal bands. The sides run in guide slots. To serve as Venetian blinds they are worked in the ordinary way. To serve as sun blinds the metal frame is thrown forward by a simple projecting apparatus, in which position it can be raised or lowered from within by an endless leather cord. To serve as a shutter, the bottom is locked. A blind 6 feet in length will roll up into a space of 6 inches. Mr. W. Baumann is exhibiting in the annexe.

The Mansfield patent "Self-Centring" socket pipes, of which Mr. H. Rylatt is the patentee, have attracted international attention. They defy careless workmanship, inasmuch as one pipe on being fitted into another cannot be laid otherwise than in perfect alignment, thanks to the "bars" which keep the spigot to the dead centre. The joint is made with Portland cement. In an experiment carried out last month on two 6-inch pipes, in order to test the soundness of the joint, when the head of water sustained by it was 40 feet there was only a very small weeping at top of joint, which proved to be due to a slight air space in the cement. But no sign of moisture showed at the base. According to the report, "The bars showed no tendency to separate from the cement, and they were entirely embedded simply by putting the cement in joint after placing pipes together. The joints stood excellently." The slightly increased cost of the pipes is more than counterbalanced in the reduced cost of laying. H. R. Mansfield shows other sanitary manufactures.

The Timber Corporation, Ltd., possess large jarrah forests in Western Australia. This red hardwood has long enjoyed a high reputation as paving blocks. Jarrah when fresh cut weighs a little more than 70 lbs. per cubic foot, which is reduced to 60 lbs. when it is properly seasoned. It has been utilised for railway sleepers, piles for dock and harbour work, waggon and carriage building, engineering and constructional purposes, building and all general work, fencing, &c. The stand has been converted into a room to show jarrah wood furniture as made by Messrs. Waring & Gillow. The effect is handsome.

Brown & Co., of Glasgow, are exhibiting their "Simplex" window fittings, which, being fitted to either new or old

THE FIREPROOF CO., Ltd., 10 York Buildings, Adelphi, W.C.

casements, enable the windows to be brought into the room for cleaning. In Scotland they attach great importance to this subject. In 1895 Brown's fittings were adopted by the Glasgow Corporation, and, according to the Glasgow Building Regulations Act (1900), it will be a penal offence after July 31, 1907, to have windows above the ground floor unprovided with means of opening inwards for cleaning purposes. The fittings are officially approved also by the Edinburgh Corporation, and we might add that unofficial approval is bestowed on them by all who use them.

Merchants and manufacturers such as *Messrs. W. R. Froy & Sons* must experience curious difficulty in deciding what they will select for exhibitions. At their show-rooms in Hammersmith they have more than 11,500 square feet of floor-space at their command. Olympia demanded exercise of great elective talent if the stock was to be adequately suggested. They show ranges, stoves and builders' ironwork. Those in search of a cheap grate, mantel and surrounds should ask to see the "Sackville."

The Westminster Sanitary Works are well represented. *Messrs. Davis, Bennett & Co.* show two model bath-rooms that would captivate even the great unwashed and render the thought of a thorough cleansing a delight instead of a terror. Baths of all sorts may be seen together with all kinds of adjuncts. Sanitary appliances of many kinds are on show—urinals, sinks, w.c.'s, drainage fittings, &c. They have a fine selection of enamelled tile dadoes.

The *Van Kannel Revolving Door Co., Ltd.*, have every reason to be gratified by the attention bestowed upon their exhibit during the past fortnight. Many of the visitors have never perhaps had a previous opportunity of seeing it, although the door is fitted in several large hotels, restaurants and offices in London. Four door wings are attached to a central pivot, which work in a circular casing. They so revolve that two of the four arms are always in contact with two opposite segments of the casing, thereby excluding any possibility of draught, the entry of fog, &c. These wings can be folded together, two on each side of the half-circle, like a diameter; and, furthermore, they can when so folded be pushed to one side, leaving the circular frame practically empty. The doors are recommended for factories, warehouses, cotton and woollen mills, and work-houses, kitchens, &c., as well as more expensive structures.

A striking panorama has been displayed by the *Road Maintenance and Stone Supply Company, Ltd.* Framed in imitation rockwork is a large view of the lower breaking platform of their quartzite quarries in Cherbourg, with small figures represented as busily engaged in supplying the demand made for this hard compact blue stone by road surveyors and engineers. The company work quarries in Cherbourg, Guernsey, North Wales, Germany and Quenast.

The *Fireproof Company, Ltd.*, are exhibiting dovetail corrugated steel sheeting, and show in a practical form the construction of fireproof partitions, which finish at a minimum thickness of 2 inches, also 3-inch work, to conform to L.C.C. requirements for enclosing lifts and staircases. The sheeting is equally applicable to straight and circular work. As arch centring for concrete floors it provides a good key on the underside for plastering, or it can be left for painting. Their cheap form of fireproof floor has special section beams of bow shape calculated to contain the minimum amount of metal required to carry the load anticipated. No. 3 section is for laying on the tops of wooden joists and forming a thin concrete floor suitable for sculleries of flats and light roofs. Various sections of rolled steel joists have been brought from their stock at Lambeth Works. There is a novel form of damp-course formed of No. 3 section of corrugated sheeting, which can be covered on both sides with cement, forming an impenetrable barrier against the rise of damp. The Camjud partition slabs shown are claimed to be the cheapest fireproof partitions on the market. A feature to particularly note is their hollow fireproof and soundproof partition, which can be constructed at from 5 to 6 inches finishing thickness.

"Dodo" is a distinctive name applied by *Messrs. Duggan, Neel & McCollm, Ltd.*, to their japan; enamel, which can be had in any colour, and flattening. Their stall demonstrates the high quality of these materials, and it cannot fail to bring joy to the decorator.

The direct simplicity of the exhibit of *Sutton & Co.* makes a forcible impression. No futile attempt is made to decorate their imposing collection of stoneware goods, which comprise pipes and connections, conduits and troughs for electric cables, &c.

Published every Friday by **GILBERT WOOD & Co., Ltd.**, at the
Offices, 6-11 Imperial Buildings, Ludgate Circus, London, E.C.

The *Limmer Asphalte Paving Co., Ltd.*, principally obtain their mineral rock asphalte from Ragusa, Sicily; Hanover, Germany; and Montrotier Seyssel, France. The London works are at Learmouth Wharf, Blackwall, E. As everybody knows, the asphalte is used for roofing, flooring, lamp-courses and other purposes. It has been adapted to Bishop's patent non-slipping stair-tread.

The *Bristol Waggon and Carriage Works Company, Ltd.*, include among a large assortment a light builder's, and one for heavier purposes. They show other vans to catch the attention and orders of borough surveyors and similar officials, such as their patent improved four-wheel water-van (which dispenses with the customary distributing pipe or box); an ambulance van; a new and improved patent screw tip waggon with their automatic covers and jack board, which rise clear of the load when the waggon is tipped.

Messrs. J. O. Grant & Taylor are electrical engineers and contractors. The designs of their electric table-lamps must commend themselves. They display numerous other aids and appliances for utilising electricity under many forms.

A large ornamental pond in which goldfish can be watched disporting themselves (an occupation affording harmless amusement to many) is the striking method chosen by G. M. Callender & Co., Ltd., to display the virtues of the lining material "Callendrite"—a pure Trinidad lake bitumen sheeting. It abundantly proves itself to be innocuous to fish and plant life, and could be safely employed for lining reservoirs, swimming-baths, basements, &c.

An interesting exhibit is that of the new jointless flooring "Doloment" at Stand 203 Annexe. Although only recently introduced into this country, the *British Doloment Company* have secured contracts with H.M. Office of Works, War Office, London County Council, &c. The great claim for "Doloment" is that by the patented method and material utilised and the elasticity of the intermediate layer, it overcomes the great difficulty which has hitherto been associated with systems of jointless floors, so that although the foundation upon which it is laid may settle or crack, "Doloment" retains an unbroken surface. This system of flooring can be laid on any surface, whether concrete, cement or wood, and is absolutely non-porous; it is therefore impervious to dust, liquids, insects, &c. The

material permits of fine finish either with an effect of mosaic or marble.

The *Patent Adjustable Bath Company* are showing their patent "Tip-up Bath" at Stand 56, Row B, a useful little novelty for flats, tenement houses and the week-end cottage. Very little space is required for fixing, and as there is no fitted tap over the bath the water rate is not increased. This invention makes it possible to bring the luxury of the bath into every cottage throughout the country. A large number are in use at Bournville and have given every satisfaction.

The space at our command being circumscribed, we are forced to regretfully admit an inability to note all the innumerable interesting and instructive exhibits brought to Olympia. At the end of the official catalogue there is a classified list of exhibits. It appears wisest to follow that order, and to mention such firms as have not been previously noted by us. The makers of *Art Metalwork* include—Crittall Manufacturing Co., Ltd., Gawthorp & Sons, Kupron, Ltd., Stanley Jones & Co., and E. Worrall & Co. *Artificial Stone* is shown by British Doloment Company, Ltd., and other firms, to whom allusion has already been made. *Baths* as supplied by the Patent Adjustable Bath Company, Shanks & Co. (with five bath-rooms fitted up) and Winkle & Co. *Blinds* by Messrs. G. A. Williams & Son. *Boilers, &c.*, are shown by Fenlon & Son, R. O. Meyer, Ltd., and the Phoenix Engineering Company, Ltd. *Brick, Tile and Pipe-making Machinery* shown by P. Bawden, Johnson & Sons, Ltd., T. Middleton & Co., Ltd., Nuneaton Engineering Company, Pullan & Mann, the Rawdon Foundry Company, Ltd., Sutcliffe, Speakman & Co., Ltd. *Bricks, Tiles, Terra-cotta and Sanitary Pipes* are shown by the Bursledon Brick Company, Ltd., W. C. Candy, Coalbrookdale Company, Ltd., S. & E. Collier, Ltd., Crossley & Sons, Ltd., Dodsdown Brickworks, Ltd., W. Exley & Sons, Hygienic Glass Tile Company, Ltd., Improved Construction Company, Ltd., London Brick Company, H. J. & C. Major, Ltd., Mansfield Bros., Prestage & Co., the Silverdale Tileries, the Somerset Trading Company, Ltd., Standard Brick and Terra-cotta Company, Stanley Bros., Ltd., and R. Trower. *Compoboard* is shown by H. G. Goodwin & Son.

Are you interested in WOOD PRESERVATION?

ANTHROL protects all varieties of wood from decay, whether the situation be damp or dry, and from the ravages of all wood-destroying insects, including the white ant on shore and the teredo in sea water. Rats will not gnaw wood which has been treated with

ANTHROL. Full particulars and prices will be sent on application.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. ANTHROL does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, ANTHROL, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

THE Bethnal Green Borough Council are seeking a site in Cambridge Road for the erection of municipal offices.

PATENT DIRECT-ACTING VERTICAL STEAM PUMPS

FOR
BOILER FEEDING
AGAINST HIGH PRESSURES.

MATHER & PLATT, Ltd.

ENGINEERS,

Park Works, MANCHESTER.

Salford Ironworks, MANCHESTER.

Queen Anne's Chambers, Westminster, LONDON.

TRADE NOTES.

large show-rooms and warehouse erected by Messrs. Baney & Co., Dale End, Birmingham, have been fitted with a complete warming apparatus by Thos. T. Smith & heating and ventilating engineers, Leicester.

The thirty-seventh "City of London Directory" has been issued by Messrs. W. H. & L. Collingridge. It could have appeared earlier in the year owing to the impossibility of obtaining certain exclusive information. The alphabetical sections are complete, and not only are the names of the owners of houses given, but the floors on which they are found. The biographical section is up-to-date, and the streets in London during the past year are shown on the map. A better index to the City could not be devised for 2s. 6d.

VARIETIES.

The works committee of the Southampton Harbour Board recommend the expenditure of 50,000*l.* on deepening the channel approaches.

An inquiry has been held at the town hall, Derby, on an application by the Corporation to borrow 3,450*l.* to acquire property at the corner of the Strand and Cheapside for the extension of the Art Gallery and Museum.

The Midland Railway Company have purchased property and lands, exceeding 60,000*l.* in value, for the purpose of extending and improving the station, which is now out of keeping with the surroundings.

Messrs. GEORGE CRADOCK & Co., of Wakefield, have received an order from the Glasgow and District Subway Company for a tramway cable to work their line. This rope is 6,300 feet long and 1½ inch diameter, and weighs approximately 57 to 60 tons.

At an inquest in London on a plumber who died as the result of falling from a scaffold, a factory inspector informed the jury that the whole subject of scaffold accidents was under the consideration of a committee appointed by the Local Government Secretary, and the result of their deliberations would be a code of rules which would have statutory force. One of the regulations would be that no scaffold board end would

be allowed to project more than six inches over a putlog unless secured.

MARTINEAU MEMORIAL, NORWICH.

THESE buildings, of which the foundation-stone will be laid to-morrow, are to be dedicated as the centenary memorial of Dr. James Martineau, and are for the use of the Octagon chapel and Sunday school, for which purpose they have been carefully planned after many months of careful consideration by the architect, Mr. H. Chatfield Clarke, F.R.I.B.A., in consultation with the building committee. A site has been acquired on the north side of Colegate Street, adjoining the entrance to the Octagon chapel, and between it and the entrance to the old meeting-house, a site that is closely associated with liberal religious thought in Norwich, and eminently suitable to the needs of this memorial. On this site it is intended that the memorial buildings should occupy one-half, leaving two houses on the other half, the rentals of which will assist the maintenance of the new buildings. The new buildings have been designed externally in keeping with the Octagon chapel and surroundings in the traditional manner of domestic English buildings prevalent two centuries ago. Local materials will be used in facing the walls and the roofs covered with red tiles. There are two storeys in the main building, with a third storey over a portion facing Colegate Street. The ground floor contains two large classrooms and entrance hall, also two stone fireproof staircases to the upper floor, and kitchen accommodation and lavatories. On the first floor are a large lecture hall with raised stage, and a large classroom capable of being added to lecture hall, so that seating accommodation could be provided for nearly 350 persons. There are also on this floor three smaller classrooms and minister's parlour. On the upper floor at the front are a large recreation-room and an ante-room adjoining. Both externally and internally all elaboration of detail in building has been avoided, and any good results will be due only to proportion and effective use of material. The contract for the erection of the building has been placed with Messrs. Scarles Bros., of Norwich, Messrs. J. & J. King, also of Norwich, undertaking the sanitary, plumbing and decorative work. The total cost is estimated at about 4,000*l.*

NEW CATALOGUES.

THE Ruberoid Company have shown applications of their materials to a variety of buildings in their catalogue, and, if the illustrations do not extend from China to Peru, we see at least buildings in Paris, India, Boston, U.S., South Africa, in addition to a surprising variety in this country. Climate does not appear to diminish the excellence of Ruberoid as a roof covering, damp-course or flooring. It has been in use since 1891, and the years which have elapsed are surely sufficient to test the qualities of any building material. Another advantage is the moderate cost. A square of 100 super feet of 3-ply Ruberoid fixed complete in London is only 1*l.* 7*s.* 6*d.* It can be used for vertical as well as horizontal damp-courses. The catalogue supplies full information about weight, cost, fixing on roofs or on walls or floors, and has, moreover, the great advantage of an arrangement which allows of instantaneous reference, a consideration which busy men will appreciate.

MESSRS. PARNALL & SONS, LTD., have reason to describe themselves as "architectural ironfounders," and they are competent to meet all the responsibilities which the title suggests. Their specialties comprise whatever is made in metal which can be used in the construction and furnishing of buildings. The latest improvements will be found in their products, and from their ability to keep abreast with progress, their trade is not determined by local boundaries. Their latest catalogue (No. F 132) comprises a variety of register grates with easily-adjusted canopies and fall-down bars and tiled hobs, economical cottage and other ranges of various sizes, gates and railings, standard crestings, signs with wrought-iron brackets. In all their attention has been given to form, and the treatment is pleasing and novel. Another section comprises floor gratings, manhole covers, &c. Messrs. Parnall & Sons, Ltd., have made a specialty of weighing machines and weighbridges. One of the latter, after bearing loads amounting to 3,000,000 tons, was tested by the authorities and found to be in good order. To realise the extent of the firm's operations, the whole series of their catalogues would be necessary. We have only referred to one.

THERE are people who will not believe that a thing beauty can give more than temporary joy, and for them it is necessary to prepare new designs periodically. Designs for Anaglypta and Salamander decorations are excellent, for they come from able artists, they cannot be affected by the passing of time, and there is no valid reason to prevent one which is, say, ten years old from being employed and admired to-day. But in manufactures, whims or prejudices of the public have to be accepted, thus it happens that a large volume of fascinating designs has to be supplemented by a new series for 1907. Can be said of the latter which is more laudatory than announce that they are worthy companions of the old designs? The veteran Mr. Owen Davis shows what practised power can accomplish, and co-operating with him are Mr. Haité, Mr. Rainger, Mr. Bayes and others. There are, as usual, ceilings, dados, panelling, diaphragms, fillings, friezes, &c. In some the Italian spirit is manifested, others English Renaissance. The material, having the advantage of relief or repoussé, can be used with propriety for friezes in which fruit, flowers, ships, amorini, as well as conventional forms serve as elements. The number of plates would serve to illustrate lectures or essays on modern ornamentation, for there is no indiscriminate application of forms, but all are adapted to the purpose for which they were intended as well as for the peculiar material. Plans are also given which show the general effect of a repetition of the designs.

THE arbitrator in the dispute between the Coventry District Master Builders' Association and the Builders' Labourers' Society has given his award providing for alteration of rules in regard to what is known as "walk-out time." This is to be allowed to all work beyond one and a half mile from Broadgate at the rate of three miles per hour to be measured from such boundary, the operative to walk home in his own time except on Saturdays. Lodging shall be paid for at all work beyond four miles distance at the rate of 3*s.* per week. Third-class fare to be allowed and out once a week to all work up to ten miles, and at that distance special arrangements to be made between employer and employed.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

TRADE NOTES.

MESSRS. CLARK & Co. have arranged with Mr. H. Mason, 40 Brazennose Street, Manchester, to represent them for the sale of their "Xelite" plaster in Lancashire, Cheshire and Staffordshire.

MESSRS. JOYCE, Whitchurch, Salop, have this week sent out a very large quarter clock with four dials to Greymouth, New Zealand. The same firm are making a new striking clock for Cowbit Church, near Spalding, and another for Harpswell Church, Gainsborough. Also two illuminated clocks for the Salford Corporation, for their new tram depôt at Pendleton.

THE Auctioneers' Institute will hold its annual general meeting on May 9 at the Institute, 34 Russell Square, London. The coming of age of the Institute will be celebrated by a banquet at the Hotel Cecil on Thursday, May 9, at 6.30 for 7 P.M., when many distinguished guests will be present. The president, Mr. Henry D. Buckland, will occupy the chair.

"ZINGESSOL" DECORATION.

DISTEMPER painting has antiquity in its favour, for there is no doubt it was known to the monk Theophilus, who about the beginning of the thirteenth century recorded his own observations and the traditions with which he was acquainted. There are old examples, in Italy especially, which are sometimes supposed to be works in fresco, which if not entirely executed in distemper, owe their surfacing to that material, for there is no doubt that walls which were begun in fresco were finished in distemper. Attempts have been made from time to time in England to employ the kind of paint for decoration. If any of our readers should be engaged in restoring a building in which they are found, and even if the figures and ornament are not twenty years old, we strongly advise them to avoid interfering with the painter's work. If they are touched with a damp cloth or even with a feather brush they vanish as if by magic. The reason is that "Zingessol," which is a genuine washable distemper, had not been discovered by Mr. J. B. Orr, of Widnes. The chancel arch of Great Sankey Church has just been decorated by Mr. R. H. Webster with that paint, and thus again demonstrated its fitness for the highest class of work. The subject selected was "The Six Days of Creation." In the centre stand the two archangels, St. Michael and St. Gabriel. The symbols which suggest the mysterious operations are enclosed in circles outlined in red, and which are flanked by angelic figures. Beneath in bold letters is the inscription, "All Thy works praise Thee, O Lord." The ground adopted is a reposeful green. The lining of mouldings and medallions is in red, and the ground of the inscription is in a warm yellow. The white robes of the angels, who appear to guard the Tree of Knowledge, stand out in strong contrast. A work of this kind is restful as well as suggestive, and there is also the advantage of endurance. Similar adornment could not offend the most orthodox churchgoer, and would enhance the appearance of many interiors at a moderate expense.

THE markets committee of Edinburgh Town Council have instructed the deputy city superintendent of works to prepare an estimate as to the probable cost of the whole scheme for the new markets and slaughter-houses at Gorgie.

BUILDING AND BUILDERS.

is proposed to erect an assembly hall and public
ary at Lindfield, Sussex.
The Aberdeen water committee have decided to cover
the reservoirs with cement concrete arching supported by
piers, at a cost of 23,600l.
The Sir John Maxwell school in Bengal Street, Pollok-
shaws, Glasgow, is to be re-erected in order to accommo-
date 1,200 children.
The Manchester Corporation have applied for authority
to borrow money for hydraulic purposes. The station in
Water Street is estimated to cost 50,000l.
The Gorton Council has received a letter from the Local
Government Board stating that they are not prepared to
confirm a by-law requiring the construction of external
walls of all new buildings as hollow walls. The require-
ment, they say, would be unreasonable.
The Court of Governors of the University College of
North Wales have recommended their Council to insist that
a fair-wages clause be inserted in all building contracts.
Mr. H. T. Hare, the successful architect in the recent com-
petition, hopes to have the drawings ready for the quantity
surveyor in two months' time.
At the meeting of the Hackney Borough Council the
Finance committee reported that they had examined the
priorities, bonds, contracts, agreements, conveyances and
other documents in the possession of the Council. With
regard to sureties for the performance of contracts, they
found that in several instances committees had been in the
habit of recommending the acceptance of sureties who were
not in the employment of or interested in the contracting
firm. They were of opinion that this practice was unde-

sirable, and recommended that no person employed by the
contractor, or interested in the contractor's business, should
be accepted as a surety, and that this recommendation be
sent to the committees concerned.
At the last meeting of the York City Council it was
moved that the recommendation that the tender of Messrs.
Young & Son for plasterwork be accepted should be deleted,
and this amendment was seconded. The complaint was
that the firm had employed a second apprentice some two
or three months before the first apprentice was out of his
time, against the regulations of the Society. The amend-
ment was lost, only five members voting for it.
At the Midland Institute, Birmingham, last week, under
the chairmanship of Sir William Cook, the annual meeting
of the Birmingham and District Council for the National
Registration of Plumbers was held. A resolution was
unanimously agreed to declaring the confidence of the
meeting in the co-operation of master plumbers, operative
plumbers and public representatives, as offering the best
means of securing the registration of plumbers on lines
suited to the present conditions of the plumbing industry
and fair to the interests of plumbers and the public. The
resolution also pledged the council to use its best efforts to
promote that object generally, and particularly by appealing
to the Government to initiate the legislation necessary for
the purpose in the interests of the public health.
The Hornsey Town Council has adopted a detailed
scheme, prepared by Mr. E. J. Lovegrove, the engineer
and surveyor, for the erection of 120 additional workmen's
dwellings at Highgate upon land secured from the Eccle-
siastical Commissioners. The scheme provides for the
erection of twenty-two cottages rented at 12s. 3d. weekly;
twenty-six at 10s. 6d.; twenty-four at 9s. 9d.; twenty-two
at 9s.; and twenty-six at 7s. 6d. The estimated capital ex-
penditure for the erection of the cottages, draining, fencing
and laying out and sewerage of the roads is 39,690l., to which
must be added 5,700l., the cost of the land, making a total
of 45,390l. The money is to be borrowed for sixty years,
and the suggested rentals will provide an income of
3,040l. 14s., sufficient to meet the annual repayment of
capital and interest, rates, taxes, &c., and to leave a
margin of 9½ per cent. of the rental value for empties
and repairs.

VARIETIES.

THE Duke of Portland has begun a scheme of extensive improvements on the houses of the crofters on his northern sporting estate of Berriedale, which will abolish all thatched roofs and give every crofter a substantial slated model cottage.

THE Birmingham Drainage Board have passed a resolution which authorised an application to the Local Government Board for sanction to a loan of 45,000*l* for the construction of 7 acres of bacteria beds at Minworth Greaves.

DR. REGINALD DUDFIELD, medical officer of health for Paddington, has been appointed to represent the Incorporated Society of Medical Officers of Health on the registration committee for the national registration of plumbers.

DURING the residence of the Lord High Commissioner at Holyrood Palace the lighting has hitherto been done by oil lamps, but this year a departure will be made by the introduction of petrolite safety lamps, of which about eighty will be used.

THE Glamorgan County Council are using drastic measures to save householders from lead poisoning. They are requesting Councils not to grant certificates of habitation to any houses where the water supply is in any danger of being poisoned through the use of leaden service pipes.

THE Leeds Corporation are about to advertise for tenders for the construction of the Leighton reservoir, an undertaking which is roughly estimated to cost 450,000*l*. Their engineer advises them that it will be better, having regard to the difficulties of the task and the magnitude of the undertaking, if, with the other works the Corporation have in hand, they let it by contract.

For the convenience of passengers travelling to and from Frankfort-on-Main by the Harwich route the Great Eastern Railway Company has arranged for through carriages to be run on and from May 1 between the Hook of Holland and Frankfort, *via* Mayence, in connection with the arrival and departure of the steamers. Passengers will be due to arrive at Frankfort at 4.5 P.M. and on the return journey to leave at 1.40 P.M.

THE general purposes committee of the Southport Town Council recommend the Council not to accept the amended offer made by a syndicate for leasing a portion of the foreshore for entertainment purposes. The offer proposed a rental of 1,000*l* per annum for a twenty-one years' lease with the option of renewing for a further twenty-one years should the land not be required for building purposes. The part of the foreshore mentioned consists of some 50 acres of land and water.

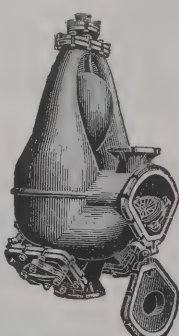

LORD ELCHO (chairman of the improvements committee of the London County Council), in reply to a question on Tuesday, said he sincerely hoped they would soon be able to revise the conditions of letting the Council's surplus lands. They had recently been considering the whole question of the surplus lands in Westminster, Hackney and elsewhere, and he hoped, in about a fortnight's time, to bring up a report on the subject which would be satisfactory to the Council.

LETCHWORTH COTTAGES AND BUILDINGS, LTD., has been formed by First Garden City, Ltd., chiefly for the purpose of erecting cottages for unskilled labourers at the Garden City estate at Letchworth, Hertfordshire. The share capital is to be 30,000*l*. A cottage costing 150*l*, including architect's fees and builder's profits, and containing three bedrooms, a good size living-room, scullery, with bath, &c., may be taken as one of several types. Such cottages have actually been built upon the estate for the sum named, and they can be readily let at 4*s*. 6*d*. per week. To this must be added rates representing (including water rate) another 8*d*., making 5*s* 2*d*. per week in all. The company will put the work of building out to contract. Applications may be made for the 12,750 Four per Cent Guaranteed Preference shares of 1*l*. each which are now offered.

MR. W. H. ORRETT, the United States Consul-General at Kingston, in a report to the Washington Bureau of Manufactures, says that although the recent catastrophe was naturally in every respect deplorable, yet it has taught the people of Jamaica invaluable lessons in building construction. The Government very wisely has under consideration a building law which aims at a uniform class of reconstructed buildings to more readily stand the violence of nature or fire, and it would appear that steel with rein-

and concrete will play an important part in this reconstruction of the principal business houses and banks. The members having appealed to the British Government for an imperial loan of nearly a million and a half to be used for construction purposes, he takes it that if it is granted stringent provisions will be made in its application so as to insure buildings being erected as earthquake and fire-proof as possible so as to safeguard the loan. Hence it is obvious that these buildings will be constructed principally of steel and reinforced concrete.

Mr. F. W. HARRIS, chemist to the Corporation, has prepared a report on the unsatisfactory ventilation of the Glasgow Council Chamber. His tests showed that a minimum figure for respiratory impurity of 4.14—twice as high as the Chaumont's limit for good ventilation—was obtained when 35 to 40 members were present; it was 7.31 when 100 members were on the floor of the House. The respiratory impurity in the House of Commons does not exceed 2. The analysis of the samples of air contained a proportion of carbonic acid gas in excess of the legal limit adopted for public buildings. Two of the samples, giving respectively 11.31 and 11.31 parts carbonic acid gas per 10,000 parts air, were in excess of the limit which Dr. Haldane concluded was reasonable to expect under ordinary circumstances in public buildings. He states it is obvious that the chief cause of inefficient ventilation is the inadequacy of the volume of air forced into the chamber. Another contributing factor is the impure quality of the air forced into the chamber through the two inlets situated nearest the speaker's room.

NEW waterworks have been completed at Basingstoke at a cost of nearly 20,000*l*. The scheme was planned by Mr. R. Phipps, the borough engineer and surveyor. The well and pumping-station is near Basingstoke station, and quite isolated from dwellings. The well is 60 feet in the chalk, with 35 yards of headings at the bottom, and yields an ample supply for the town and for the railway station, which takes one-third of the total. The water is described by the county analyst as "a typical chalk water—of the purest that can be obtained." The two well-heads, of 14 inches diameter, are of the three-throw type, the pumping capacity being 40,000 gallons an hour. The horse-power of the engines is about 65, but the actual

work done by the pumps requires only about 40 horse-power. The motive power for the machinery is supplied by a suction gas plant. The new works include a high-service reservoir at Cliddesden and new mains to the old reservoirs at South View, which supply the low levels, and to the new reservoir, which has a capacity of 240,000 gallons.

THREE years ago it was decided to construct the terminus of the Soudan railways at Port Soudan, the name given to an inlet on the west coast of the Red Sea, formerly known as Sheikh Bargout, 700 miles south of Suez and thirty-five miles north of Souakin. According to the local consul the town is at present composed of temporary wooden buildings, occupied by a population of about 5,000. Water is laid on from wells to houses belonging to the Government, and also to a series of hydrants in case a fire should break out. The possibilities for British trade in a new market such as this demand special consideration. Mr. Hohler thinks that competition might be made with Austria-Hungary in supplying cheap furniture of almost all kinds—cupboards, bentwood chairs, tables, &c. There is an excellent opening for ironware, light girders for building in particular. These are at present supplied from Belgium. They are considerably lighter and much cheaper than those of British make, and are apparently strong enough for the work they have to do. There is no reason whatever why British manufacturers could not produce these girders. The demand for them will be very considerable when the land tenure question is settled and the building of the town commences in earnest. Germany supplies a quantity of house fittings, locks, door handles, clasps for French doors, &c., also enamelware of a cheap quality. Here again there is an opening.

THE BUILDING TRADES EXHIBITION, OLYMPIA.

SOME of the exhibitors were careful to draw attention to the fact that what they displayed had not been specially prepared for Olympia, but was a fair example of their productions. In the case of *Elliott's Moulding and Joinery Company, Ltd.*, of Newbury, there was no need for this, at any rate so far as the most conspicuous feature of their stall was concerned. We have already expressed admiration for the imposing door in oak and yellow pine which

PATERSON'S BITUMEN DAMP COURSE.

Sole Makers: **JOHNSON & PHILLIPS, Ltd.,** Victoria Works, Charlton, S.O., Kent.

was made for the front entrance of New York Lodge, Bourne End, a residence being fitted up for a wealthy American. Unfortunately (and yet fortunately) the owner arrived in England. As a consequence, Messrs. Elliott had to remove the doors from Olympia to Bourne End and erect them post haste. We say fortunately because it has provided us with an opportunity of seeing another highly creditable specimen of the workmanship turned out from Newbury. This time it is a solid Spanish mahogany circular vestibule in course of preparation for the Capital and Counties Bank, Weston-super-Mare, according to the design of the architects, Messrs. Hans Price & William Jane. Presumably Messrs. Elliott sell their doors as fast as they can make them, because the present example has yet to receive finishing touches at the Newbury works. Most people would, however, presume that the woodwork had already reached its highest state of perfection, for it is difficult to see how it can be improved upon in appearance.

If Messrs. Phillips & Son, Speedwell Works, Birmingham, had their way safe-breakers would rapidly become an extinct race. There can be little doubt that they are dying out even now, thanks to modern ingenuity. But Messrs. Phillips are pitiless and wish to remove their very means of subsistence. The greatest burglar artist will have to confess himself outmanœuvred when he tries persuasion on their new patent channel bolt, and, seeing his occupation disappearing, will perhaps contemplate the possible advantages of honesty. Of recent years he has been finding more and more difficulty in getting at the bolts of safes and forcing them back. What will his feelings be on finding that the door is one huge bolt, and that the harder he tries to force it (supposing he had succeeded in drilling a hole in the side) the more secure it becomes? On the outer edge of the safe door is a special rolled-steel channel section shaped something like a square hook. When the door is closed and the handle turned this section fits into another similarly shaped section, but with the hook reversed. Therefore every fraction of an inch is locked. Should the hinge be removed it still remains as firmly locked. Water, if played on the surface, would have no opening through which to penetrate. This channel bolt is fitted to all sizes of safes. Protection of another kind is offered by their patent keyhole safety plug. This is intended to enable a safe, of which two or

more keys are in use, to be secured against any but master key. To achieve this one key is supplied which can unscrew at the point where the handle projects beyond the keyhole. The master key is inserted and then twisted once or twice so as to detach the handle. The key then acts as an immovable plug until the handle is again screwed on.

The Colne River Varnish and Enamel Company, of W. Drayton, Middlesex, were anxious to show visitors (as we may tell them) what their specialties were capable of, and therefore arranged to decorate any woodwork introduced into the charming brick pavilion of C. H. Norris, Ltd., including its bold wooden cornice and porch pillars, painted with their snow-white flat japan, christened "Dialene." The splendour of the green front door was due to the special front door varnish. "Dialene" is made in a shell and glossy japan. It is said of it that it has a covering capacity, is easily worked, will not show over time, may be washed with ordinary soap and does not turn creamy. A sight of the pavilion was ample proof on the latter point. The price list of the twenty-six decorative varnishes made by the company compares favourably with those of other high-class varnish makers.

The Building Exhibition was not without its tribute of loyalty to the royal family. Walter C. Candy, Birmingham, showed small tile panels of the King and Queen, and moreover, had the gratification of presenting a pair to the Prince and Princess of Wales on the occasion of their memorial visit. It is a far cry to turn to their sanitary specialties. But it is with these that the stand was mostly concerned. They comprise pipes, tiles, bricks, sinks, ridges, quarry lavatory basins, chimney-pots, &c. Candy's "Wallap" upright supply closet is remarkable for its adaptability in receiving the fall pipe from the cistern, for its strength, its cheapness, and for its facility in fixing. Their lock sink drainer and plug is fixed to the sink at the works, but easily be taken out for cleaning the pipe, and serves three purposes—(1) it retains water in sink for washing, (2) it prevent back smells from sink or gulley, and (3) it stops draught up the sink pipes. In conjunction with sink they have patented an outlet pipe to flush at an angle in the direction of the yard gulley. Part of the stand was

"Marpedo" and "Antirod," manufactured by J. H. Fuller
Co., Ltd., at Reading, were both represented at the stall
of the Grooved Wallpaper Co. "Marpedo," the sanitary
water paint, is obtainable either as a paste or as
powder. The latter is prepared specially in a pure
form for ceilings and outside or inside walls. It is calcu-
lated that for ordinary work a 7-lb. tin of powder will
cover about 70 square yards (a case containing sixteen
tins costs 36s.), while 1 cwt. of paste will cover about
100 yards on plaster walls, non-porous surfaces, or
second-coat work, and costs from 30s. to 40s. "Marpedo"
has been for many years past popular as an economical and
effective covering for walls, and a substitute for oil paint
distemper. Messrs. Fuller & Co., Ltd., in addition,
brought their "Antirod" to the notice of visitors. As its
name implies, it is a patent chemical wood preservative,
which is also applicable to stone. Decay in timber in
exposed positions is frequently due to the fact that the
changes in temperature, moisture, &c., cause the fibre of
wood to contract and expand, and the rain dissolving
the soluble albumin leaves innumerable minute open-
ings exposed to the further action of the elements. We
should note that "Antirod" by direct chemical action coagulates
the soluble albumin, thus forming substances that are
practically insoluble and therefore unaffected by moisture or
change of temperature; the surface of the wood treated
with "Antirod" presents a most powerful resistance to the
decay. From practical tests it has been proved that
ordinary deal will take up as much as 10 per cent. of its
weight of "Antirod," and the more sappy the wood the
more "Antirod" it will absorb.

The "Durabar" patent draught, dust and weather ex-
cluder and water bar which was shown during the last few
years is the invention of Mr. A. R. Groome, A.R.I.B.A., of
Hereford. It is very simple in its construction, there is no
complicated mechanism or springs, neither is there any pin-
striking plate projecting out at the end of the excluder to
catch in one's clothes. It is brought into action by the
lifting of the door, and rapidly and silently raises itself up
from the floor or other surface immediately the door is
closed, so that there is no rubbing or wearing of the carpet,

&c., or of the excluder itself. It appears as if it would be
as durable as it is simple. It can be applied to old or new,
interior or exterior, single or double doors, and to inward-
opening casement windows. It is made in two patterns,
A and B. Pattern A can be affixed without the aid of a
joiner, it being simply screwed on to the surface of the
door, and rather adds to the appearance of it. Pattern B
is applied underneath, the bottom of the door being rebated
to receive it, and when fixed it is practically out of sight.
The sole makers of the Durabar are the Draught, Dust
and Weather Excluder Company, whose offices are Palace
Chambers, Hereford.

The exhibition at Olympia has excelled its predecessors
in the number of visitors and the interest taken in the
contents of the stalls. It must be allowed that on no
former occasion was so creditable a display brought
together, and the exhibitors, we hope, will be amply repaid
for their enterprise.

A HEATING DISPUTE.

THE following letter has been addressed to the convener
or chairman of the Dundee School Board by Mr. J. H.
Langlands, the architect, concerning the contracts for heating
in two of the schools:—

"After the serious charges which appeared in the letter
addressed to the board by Messrs. G. H. Nicoll & Co. and
Mr. Keay I deem it my duty to the board and to myself to
put you, as convener, and, through you, the board, in pos-
session of a full explanation of the matter. On July 6,
1905, offers were taken in for the heating of the Harris
Academy. Messrs. A. L. Peacock & Co. were the lowest
and the successful contractors, and they carried out the
work to my entire satisfaction, and I have pleasure in
knowing that the system has all along worked remarkably
well. Messrs. G. H. Nicoll & Co. and Mr. Keay were un-
successful offerers. It is alleged that whereas the specifica-
tion required wrought-iron fittings, cast-iron fittings have
been substituted, to the disadvantage of the board, and that
full payment was made. The specifications, of which the
complainants had copies, made no mention as to whether
wrought-iron or cast must be used, and the contractors
would be entitled to use the latter, both pipings and fittings,
if sufficient weight were used; but absolutely not an inch

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at
the New Government Offices in Whitehall,
under the direction of a sub-committee of
the Coal Smoke Abatement Society, in
conjunction with Sir Henry Tanner and a
committee of experts, for smoke abatement,
heating power, fuel economy, and suit-
ability for public and private buildings.

**N.B.—All Grates bear the Trade Mark and Name of
"Drawwell" on firebrick to insure against imitation.**

where the "Drawwell" can be seen in action.

of cast-iron piping was used. The piping is entirely of wrought-iron. Another charge is that, whereas the specification demands a double system of piping, the job has been carried out on the one-pipe system. This is incorrect. The double system (flow and return mains) was faithfully carried out, as may be seen by you or any party who will take the trouble to examine. It is true there is only one riser and one valve to each radiator. Before commencing I was doubtful whether in an old building such as the portion in question single risers could be successfully used owing to the arrangement and plan of the building, and I therefore specified $\frac{3}{4}$ -inch return pipes and valves for each radiator to be used, if found necessary. In the course of construction I found that single risers were practicable, and accordingly carried out the job with them. The actual piping used on the job, which includes the risers, was measured, as can be seen from my measurement book, before the account was paid, and piping and valves not used were deducted. The contractors' offer was 220*l.*, and the total amount paid was 245*l.* 13*s.* 3*d.*, or 25*l.* 13*s.* 3*d.* over the contract. This was made up as follows:—When ordering the fan from the makers they warned me that a 36-inch fan going at the speed necessary for the amount of air required to pass would be liable to cause such noise as would be disagreeable in the classrooms immediately over, and on this practical advice I substituted a 48-inch fan at an additional cost of 18*l.* During the execution of the work the teacher complained of the want of heat in the workshop, and I introduced a radiator there at a cost of 5*l.* 10*s.* The balance, 2*l.* 3*s.* 3*d.*, was caused by incidental small items. With regard to the covering of pipes, it is correct that moulded asbestos was specified and ordinary asbestos used, but that was found more suitable as there were so many bends. The material is the same, the only difference being that in the one case it is brought moulded on the job in sections and fixed round the pipes by straps, while in the other it is brought in the plastic state and plastered round the pipes in position. When finished the one is as expensive as the other. It will gratify me if the board, or any neutral expert they may appoint, would examine and sift the whole charges which have been made against me, with, as it appears to me, an intention to injure my professional reputation. In regard to the allegations made as to An crum

Road school and New East End school system, I will prepared to give such explanations as, I am convinced, must be satisfactory to yourself and the board."

THE STORY OF THE BRICK.

THE building brick is such a common thing that one may excused for supposing that it always existed, and so simple that it needed no discoverer, yet there was a time when it did not exist. It was "necessity, the mother of invention" which called it, like many other things, into being. A recent Babylonian expedition of the University of Chicago says the director, Professor Banks, in the *Scientific American* while excavating at Bismya discovered that the brick first employed in Mesopotamia nearly 10,000 years ago, that level alluvial plain, absolutely without stones for building material, but with an abundance of clay, primitive when he wished for a house more substantial than one reeds constructed its walls of the common clay soil of ground. Experience taught him that if the clay was moulded and dried in the sun it would be more durable. When he laid a chunk of moist clay in the sun to dry, made the first brick.

In the lowest strata of the ruins of the exceeding ancient city of Bismya, walls of these shapeless bricks were discovered; it was at a very early period that Babylonians began to form the clay in a rectangular mould as the modern Arabs of the desert still continue to do.

The man who first discovered that bricks could be burned was that half-naked Babylonian of about 4500 B.C. who, while poking among the ashes of his old camp fire, saw that the once moist clay beneath it had become hard and red. The first bricks which he burned were exceedingly crude in shape, flat on the bottom where the moist clay had rested upon the ground to dry, and rounded on the top. Although the form was suggestive of the rectangular, bulging sides gave it a somewhat circular appearance, soft mud, if placed upon the ground to dry, would assume this shape. These early bricks were small and thin, measuring about 20 centimetres in length and 5 in thickness, yet as time progressed they rapidly grew to about twice that size.

bricks from his kiln is but imitating the brickmaker of
years ago. The earliest known mark which appears
the surface of the ancient brick was made by pressing
of the thumb or of a round stick into the soft clay.
bricks became larger, an interesting system of
marks was adopted by the royal builders. The first
of the series consisted of but a straight line drawn
across the surface of the brick; the next genera-
tion drew the mark by drawing a line diagonally and the
third added a diagonal line forming a Saint Andrew's cross.
The fourth generation drew two parallel lines lengthwise
the surface of the brick, the fifth drew them diagonally,
and the series continued with three, four and five lines.
The dynasty came to an end
far from 3800 B.C. the Semites invaded Babylonia,
Sargon, the king of about that date, modified the brick
square shape, a form which has continued in the
to the present time. He also discarded the ancient
of brick marks to adopt a stamped impression of
one and titles. His son, Naram Sin, finding the large
of Sargon, which measured 42 centimetres square
in thickness, too cumbersome, reduced them to about
centimetres square. A thousand years later, or about
B.C., the size had been reduced to about 30 centi-
metres, with the thickness of 6 centimetres. Thus they
came to the end of the Babylonian Empire, and the
of Nebuchadnezzar at Babylon were entirely con-
d of them.
The brick inscription, which first appeared in 3800 B.C.,
was engraved but more frequently stamped, was
placed upon every brick of a structure. Naram Sin
had a few of his bricks with the brief legend, "Naram
the Builder of the Temple of Ishtar." Of later kings
inscriptions, which were longer, appeared upon a
number of bricks. I found in the Bismya temple
one of every twenty bricks of Dungi of 2750 B.C.
marked with nine lines. Nebuchadnezzar stamped nearly
every brick in his numerous vast constructions with a
inscription which read:—
Nebuchadnezzar, king of Babylon,
The restorer of the temples Esagil and Ezida,
The first-born son of Nabopolassar, king of Babylon."
The mason of about 2800 B.C., while laying the square

brick, found that to end the courses evenly it was necessary
to break a brick into halves. The manufacture of half-
bricks then began, and thus arose a brick of the shape and
approximately the size of those employed in our own
country and in Europe. Together with the half-brick, as
architecture became more complicated, the Babylonians
employed other forms for binding the corners of walls,
building columns and wells, and for ornamentation. Some
were circular or semicircular, some were wedge shape with
a rounded base or with the point missing; some were
square, with one or more edges concave or convex, and of
others a square from one corner had been omitted.

In laying the bricks those of a plano-convex shape,
which were employed about 4500 B.C., were set in the wall
upon one edge and held in place with bitumen, the black
pitch which comes from the hot springs at Hit, upon the
Euphrates, or more frequently with mud. While the use
of both bitumen and mud continued, some from the edge of
the Arabian plateau was employed before Nebuchadnezzar's
time. It is now the common cement of Mesopotamia.

Thus the brick and the brick stamp arose. Several
thousands of years were required for its evolution from
the lump of clay to the form which the Babylonians re-
garded as perfect. In durability and in the variety of
shapes the skill of the early brickmaker has never been
surpassed. At Bismya we found bricks from 4500 B.C. as
perfect as upon the day they were made, and our large
desert house was constructed mostly of them. Our desert
well was walled up with bricks 5,000 years old, and they
will still be perfect long after the ordinary brick from the
modern American kiln shall have crumbled to dust. In
the latter days of Babylon, after the process of glazing had
been discovered, huge designs of animals in various colours
were represented in relief upon the brick walls, and so
perfect was the design that each brick was moulded as care-
fully as the sculptor now shapes the various stones which
are fitted together to form a richly carved monument.

To the archæologist this discovery of the origin and
development of the brick and their stamps is of more than
usual interest. It not only increases his knowledge of the
life of early man, but, what is more valuable, it presents
him with a clue by which he may determine at a glance the
comparative if not the absolute age of the ruins of the many

TARRING ROADS.

In connection with the competitions being carried out by the Roads Improvement Association, acting on behalf of the Royal Automobile Club and the Motor Union of Great Britain and Ireland, for (1) the best machine for spreading tar upon existing road surfaces, and (2) the best preparation of tar suitable for road purposes, seventeen entries have been received—eight tar-spreading machines and nine preparations of tar. It has been provisionally decided that the experiments in connection with the competitions should be carried out in the proximity of London about the middle of May. The following is a list of the various competitors:—

Tar-Spreading Machine Competition.

Thomas Aitken, County Buildings, Cupar-Fife, one machine.

Emulsifix, 55 Cross Street, Manchester, one machine.

Johnstone-Lassailly Patent Road Binder Company, 45 Parliament Street, London, one machine.

Tarmaciser, Ltd., 7 Victoria Street, London, one machine.

Tarspra, Ltd., 20 Victoria Street, London, three machines.

Thwaite & Thorp, 29 Great George Street, Westminster, one machine.

Tar Preparation Competition.

A. I. Craig, c/o. Wishart & Sanderson, 15 York Place, Edinburgh, two preparations.

R. S. Clare & Co., tar distillers, Liverpool, one preparation.

Ermenite, Woodbank, Matlock Bath, one preparation.

Gas Light and Coke Company, London, one preparation.

Hahnite, 3-4 Great Winchester Street, London, one preparation.

Kay Bros., Ltd., St. Petersgate Mills, Stockport, one preparation.

T. G. Marriott, 328 Renfrew Street, Glasgow, one preparation.

Tar (Patents) Solidifying and Distilling Company, Ltd., 15 Mansion House Chambers, London, one preparation.

BRIDGE CONSTRUCTION.

At the ordinary meeting of the Institution of Civil Engineers on the 16th inst., Sir Alexander Kennedy, LL.D., F.R.S., president, in the chair, the papers read were "The Pyrmont Bridge, Sydney, N.S.W.," by P. Allan, M.Inst.C.E., "Swing-Bridge over the River Avon at Bristol," by W. I. Savile, Assoc.M.Inst.C.E.

The Pyrmont Bridge across Darling Harbour replacing the old bridge built by a private company in 1857 is a new bridge and its approaches extend from Sussex Street on the city side to Murray Street on the Pyrmont shore a distance of 1,825 feet, the length of the bridge proper being 1,210 feet. There are three 30-feet clear openings in the Sydney approach for vehicular traffic to wharves; while the Pyrmont side the Darling Island Railway passes under a steel bridge of 25 feet span. Electrical motive power is used for working the swing-span, also for roadway lighting, the whole being operated by one man from a conning-tower on the centre of the swing-span. The approaches are imposing in character, owing to the north or exposed, sides of abutments and retaining-walls built faced with Pyrmont freestone. The clear headway at high-water mark is 25 feet under the side spans, which are twelve in number, with trusses of the Howe type slightly modified.

The wrought-iron caisson forming the pivot-pier has a diameter of 42 feet, is 53 feet 1½ inch in length, and the concentric rings of which it is composed are connected by angle-bar bracing, the inner ring being splayed out at bottom to form a cutting edge. It was sunk by dredging to the rock, which had a dip of 8 feet in diameter.

The first section, weighing 50 tons, was put together on an ironbark frame suspended by wire ropes from the already erected permanent protecting platform. The lifts were eased off till floating point, when section after section was built on, until the harbour-bed was nearly reached, weighting being done by depositing concrete between the walls. Care had been taken previously to level off the bed and the caisson was brought to true position by forcing wedges between timber guides against the side of

and the piles of the platform. Once grounded, the material was removed by means of a bucket dredger rock was reached. Bores having disclosed 25 feet of sandy clay, it was intended to excavate in the dry in opening rock sufficiently to enable the cutting edge to bed on the solid for its whole periphery. When the was pumped out the caisson listed 11 inches out of but only two small leaks occurred. Excavation proceeded on the high side, the caisson being lowered 2 feet in eight hours, when a "blow" filled the chamber in a few minutes, but did not alter the plumb. This was less due to the stiff clay not following the cant, the head eventually breaking the seal.

The advantage of a dry foundation was considered so that pumping-out was decided upon, despite the alternative of excavation and depositing of the bottom of concrete by divers which had been provided for in the contract. A large bank of clay was put in position for excavation of the remaining 6 feet of rock in the wet and proceeded with by "jumpers." During excavation the caisson was kept near the top of the inner wall. Upon rock being cleared about 1 foot, water was pumped down about 1 foot, and the caisson was allowed to settle, this being done until the contract depth was reached. Non-competence of strata and any consequent tilting was immediately dealt with, the cutting edge being ultimately bedded in its correct position with its top only 2½ inches out of level—within the margin of 1 foot allowed. The plumb sides of the caisson and the simple expedient of having four spirit-levels figured on the inner wall materially assisted in achieving this accuracy.

Details are then given as to how concrete was deposited in the caisson where the cutting edge was not bearing, and how the inside of the chamber was made secure before pumping out. Upon lowering the water only three small leaks were noticed, which, when led to a sump, could be kept down by pumping. Concreting was then carried on day and night up to 12 feet above the cutting edge. From this point the caisson was filled with rubble sandstone concrete, the concrete weighing up to 3 tons. The total weight on the caisson, excluding friction and buoyancy, is 6,800 tons. The rest-piers are of concrete with masonry tops, the outer one, being founded on rock, whilst that on the

Sydney side is carried on fifty-eight piles driven to the rock 64 feet below low-water mark. The site for the latter was excavated by a ladder dredge to a level clay bottom 32 feet below low-water, piles being driven to the rock with a follower, and finished alternately 2 feet and 3 feet 6 inches above this level. Sheathing was then built round, and a box for concreting was formed. After divers had removed accumulated silt, &c., sand was deposited over the whole area to obtain a clean bottom. The method adopted for depositing concrete (1,850 cubic yards in nineteen days) through water by special tripping boxes and for overcoming "slurry" are fully described.

The four N-shaped main girders forming the swing-span have horizontal tops with curved bottom booms, and are 223 feet in length, with a depth of 15 feet at the centre and 5 feet at the ends. Owing to the high speed of swinging a rigid deck span was essential, which was obtained by rivetting the buckled plates to the projecting bottom flange-plates of the top booms. The swing is of the rim-bearing type, its weight of 850 tons when swinging being distributed by means of small girders to equidistant points on the drum.

Great ingenuity was displayed by the supervising engineers in England in arranging for the treads and tracks of the turn-table to be faced up true, the diameter (35 feet) being so large that provision for turning could not be given effect to without building special lathes. The method adopted is fully described. When the parts were erected the sections fitted accurately, and the fact that the span has coasted 70 degrees after cutting off the current shows the easy running of the track.

Difficulty was experienced through the pivot moving, and owing to the rollers seizing and tearing off the ends of the radial rods. The steps taken to overcome these defects, which became serious, are fully detailed. The results were gratifying, for in the three years after effecting these alterations the swing-span was opened 18,816 times without a hitch or any expenditure for repairs, whilst there is not an idle roller, thus showing complete distribution of the weight.

The electrical equipment for operating the swing-span consists of two 50 horse-power motors, located on a machinery platform within the drum, and driving a main

horizontal shaft connected by vertical shafts and bevel-gearing to the rack at the top of the pier. The motors have a guaranteed starting effort of 5,384 lbs. at 3.143 inches radius from the centre of the armature shaft; also an armature-speed of 509 revolutions per minute in 24 seconds with load, and current not exceeding 130 amperes in either motor. Results are given of exhaustive tests made of the power and cost for opening the span. The quickest opening was 30 seconds, costing 0.357*d.*; whilst the most economical run took 55 seconds, costing 0.192*d.*, with a maximum effort of 48 horse-power.

Tables show the cost and speed of lifting the ends of the span and working the gates, while a full description of the working is given, together with details of the design of the controlling brake and the latch and catch for securing the span. The motor-gear and solenoid brakes for the gates are also described, with an account of the difficulty experienced before obtaining satisfactory results.

Current is supplied by the Railway Commissioners at 1*d.* per Board of Trade unit. During the four years 1902-6 the swing was opened 24,610 times, the cost of the current being 83*l.* 6*s.* 5*d.* The total cost of the work was 112,500*l.* The bridge was begun in 1899 and opened in 1902.

The second paper describes a bridge built by the Corporation of Bristol to carry a carriage road and a double line of the Great Western Railway across the river Avon. Part of the cost was borne by the Great Western Railway Company.

The bridge is part of a scheme of railway extension at the Bristol city docks, its main object being to provide a junction with the Great Western main line at the west end of the docks, and thus relieve the congestion caused by goods traffic at Bristol station. It also improves the road communication between Bristol and its southern suburbs.

The total length of the bridge, including approach-spans, is about 600 feet. The main feature is the swing-span, which is 202 feet 6 inches long, pivoted on a pier in the river. The two arms of this span are unequal, their lengths being 121 feet 6 inches and 81 feet respectively. All the river traffic passes through the channel spanned by the long arm, where there is a clear waterway 85 feet wide.

The swing-span and one approach-span on the north side are double-decked, the roadway being carried on the

high level and the railway on the low level. The remaining spans are on the high level and carry only the roadway, the railway being on the ground-level is carried by girders only where it is actually crossing the river.

The work was divided into four contracts, namely foundations, superstructure, machinery and interlocking.

The foundations contract includes the following work:

(a) Two river-piers, carrying respectively the pivot and the north end of the swing-span. These piers, which are of masonry and concrete, were both built as single-pile dams, and are founded on hard marl. The south abutment and approach, founded partly on concrete taken down to the marl and the remainder on pitched piles. (c) The north approach, where there are masonry abutments, two of which are founded on piles and the third is partly on piles and partly on two concrete columns, taken down to a hard bed of gravel.

The superstructure contract includes the swing-span, which the swinging weight is about 1,000 tons, and approach spans on the north side and one on the south side of the river. The paper gives particulars of the construction of all these spans and the methods of erection. A description is also given of the turntable of the swing-span and a tabular statement shows the weight of steelwork of each of the spans.

The turning-machinery consists of two three-ton reversible hydraulic engines, situated in a tower above the roadway. These engines, by means of gearing, drive vertical shafts, each of which carries a pinion at its lower end which engages in a circular rack on the lower roadway. Only one of these engines is required to be used at a time, the other being provided in case of a breakdown. Four 60-ton hydraulic presses are fixed, one at each end of each main girder, and by means of these the ends of the girders are jacked up to enable sliding blocks to be moved into position under the girders when the bridge has been closed, or to be withdrawn when the bridge is to be opened. When these sliding blocks are in position they transmit the reactions to the abutments, and the main girders are supported at each end and at the turn-table.

The paper gives a description of the navigation lights and signals, and also of the interlocking with the railway signals.

NOTICE TO ADVERTISERS.

In no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

Of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. TRADE NOTES.

The vicar, wardens and clock committee of St Saviour's parish church, Ringley, near Manchester, have placed the order for a new clock with four illuminated dials and to make the hours, with all the latest improvements inserted, with Messrs. W. Potts & Sons, clock manufacturers, of Leeds and Newcastle-upon-Tyne.

The Boyle system of ventilation (natural) has been applied to Moorfields schools, Bristol. The architect, Mr. John Mackay, Bristol, has reported that the system has proved highly successful, and is giving the greatest satisfaction. He also states that he considers this a very successful example of the efficiency of a natural system of ventilation when correctly applied, as the air in the halls, classrooms, &c., is at all times kept pure and sweet and there are no draughts.

At a meeting of the Law Society held on April 26, Mr. S. Rubinstein moved a resolution bearing on the urgent need of bringing to an end the experimental trial in the County of London of the system of compulsory registration of solicitors. The resolution was carried unanimously.

NEW CATALOGUE.

The description of their marbles, granites, mosaics and tiles which Messrs. Fenning & Co., Ltd., have prepared compels attention by the announcement on the cover of a special offer of polished granite at less than cost price. The coloured illustrations will suggest some of the varieties which are supplied by the firm, and which are exemplified in several important buildings. Among the buildings are the Baltic Exchange; Alliance Insurance offices, Capel Court; Holborn Tube station; Shoreditch town hall; Bank of England, Law Courts, London; Kingsway House, Kingsway; Manchester Stock Exchange; Bank of England, Manchester; Scottish Amicable offices, Manchester; Central Buildings, North John Street, Liverpool; Granite Buildings, Stanley Street, Liverpool. There are stock sections which can be used for several purposes, including shop fronts. It should also be noted that Messrs. Fenning supplied the material and erected the War Memorial, Aldershot, which is an excellent example of its class.

THE question of the pay and position of plumbers in the Navy has been considered in the past, and no reason is seen for its reconsideration at the present time. The rating is among the lowest paid of the artisan class, as the work requires less skill than that of the more highly-paid classes. The rating was established in 1860 with pay at the rate of 2s. 3d. a day (continuous service); this rate was increased to 2s. 5d. in 1864, and again to 3s. in 1867. It may be mentioned that some of the concessions to other classes have been in the direction of equalising their pay with that of plumbers. There are other ratings who do not rise to chief petty officers—e.g. blacksmiths, coopers, painters. As plumbers do not serve as chief petty officers, they are ineligible for the addition to pension, which is granted only for service as such. Re-engagement pay of 2d. a day is given only to seamen ratings. Plumbers' mates, being second-class petty officers, receive an increase of pay on advancement to the rating of plumber (first-class petty officer). They are also eligible for additional pay according to the number of good-conduct badges earned.

ELECTRIC NOTES.

THE electric-lighting committee of Edinburgh Town Council are considering a letter from the secretary of the Scottish National Exhibition, 1908, as to the supply of electricity for the exhibition. It is understood that the letter estimates provisionally that 100 arc lamps and from 20,000 to 30,000 incandescent lights will be required.

At the meeting of the Belfast tramways and electricity committee, the sub-committee appointed to consider the desirability of purchasing the Cavehill and Whitewell tramway system, the only local tram not owned by the Corporation, recommended the purchase of the entire tramway for the sum of 60,000*l.* This recommendation was adopted, subject to confirmation by the Council. The intrinsic value of the undertaking was set down at 40,000*l.*, but the price now proposed to be paid is that which the Corporation were prepared to offer before the Cavehill Company promoted their original Bill some few years ago.

THE law regarding the concessions of water-power in Switzerland has recently been modified, and the *Feuille Fédérale Suisse* of April 17 contains a copy of the new provisions. The utilisation of water-power is to be supervised by the Swiss Federal Government, which will enact laws regarding the granting and holding of concessions, as well as the transmission and distribution of electric-power, the provisions necessary for safeguarding public interests and insuring the rational utilisation of water-power. The Cantonal Governments may grant concessions and fix and levy the dues payable for the use of water-power. The taxes must not be too onerous. In case of sections of water common to several cantons the Federal Government is empowered to grant the concessions and to fix the dues payable to the cantons.

THE Post Office authorities are seeking for the insertion of a clause in some tramway bills by which it shall be lawful for the Postmaster-General, by himself or his agents, to use for the support of any telegraph the posts, standards and brackets erected in any street or public road by the Corporation in connection with the tramways, to lengthen, adapt and alter them for that purpose, subject to the conditions that no obstruction shall be caused to the traffic

along or user of the tramways, that not less than fourteen days' notice shall be given, that the Postmaster-General shall pay the expense of altering such post, standard or bracket for the protection of the public, &c, and that the Postmaster-General shall at his own expense make good any damage or injury and shall indemnify the Corporation against any expense to which they may be put.

THE parochial electors of Coventry at a public meeting held on Saturday approved the introduction into the Corporation Water Bill now pending in Parliament of provisions and amendments relating to the Corporation's electricity undertaking in order to provide for electricity being supplied to the parishes of St Michael Without, Holy Trinity Without, Stivichall, Allesley, Coundon, Stoke, Foleshill and Exhall. It was stated that a scheme had been adopted by the Council which made provision for immediate extensions at an estimated cost of 27,000*l.*, and for further ultimate extensions estimated to cost an additional 180,000*l.* The extensions would probably make adequate provision for the needs of the city for the next five years, but it might be necessary after that, should the city continue to grow at its present rate, to erect an auxiliary station and carry out other works, the cost of which was estimated at 125,000*l.* The capital expenditure on the electricity undertaking, including the 27,000*l.* for extensions, amounted to about 212,000*l.*

A REPORT by Mr. Sankey, borough electrical engineer of Whitehaven, explains the possibility of reducing the yearly deficit incurred on the borough electric supply. It is necessary to distinguish between supply during lighting hours and supply during non-lighting hours. There is a means of doing this by a meter with two sets of dials, the change from one dial to the other being automatically done by clockwork, which may be set to any time; 4½*d.* per unit is charged for current used from sunset to 11 P.M., but from 11 P.M. till the following sunset the charge will be 1½*d.* per unit, and after 2,500 units 1*d.* Two-rate meters being somewhat expensive, there will be a fixed charge per quarter of 5*s.* for meter and time switch, and also a minimum charge of 13*s.* 4*d.* should a consumer not use "power" to this value. That is a minimum of 18*s.* 4*d.* per quarter.

ASPINAL'S ENAMEL CO. NEW CROSS LONDON, S.E.

A LOCAL GOVERNMENT BOARD inquiry was held at Althamstow on Wednesday concerning a proposal to borrow 26,295/ for the purposes of the Council's electricity undertaking, and was adjourned *sine die* by the Board on the ground that the loan asked for was excessive.

THE British Chamber of Commerce, Genoa, has supplied the Manchester Chamber with particulars, prepared by the Association of Italian Manufacturers, Milan, of an international competition for the best scheme for the prevention of accidents from contact with live wires. The extent to which electricity is used as the driving power in mills and works in the North of Italy compels the interest of Italian manufacturers in this subject. In the synopsis of the requirements it is stated that the invention must "eliminate the danger of a contact (of whatever resistance) between the primary and secondary circuit of separate current transformers and their respective lines. The apparatus must be simple, robust, economical and adaptable to existing installations. It must come promptly into action whenever the potential to earth of the low-voltage circuit reaches the double of the normal value in a single-phase and two and a half times the normal value in a three-phase system, and it must prevent the excess of potential becoming permanent. The apparatus must not bring the transformer out of action in the event of atmospheric discharges or of such partial reduction of insulation of service lines to earth as may be tolerated in practice, so that the adoption of the system may not render the work of the installation more difficult." With each system competing for the prize an apparatus must be supplied which will enable it to be submitted to practical tests

VARIETIES.

THE Derwent Valley Water Board have accepted the tender of Messrs. Orson, Wright & Co., of South Wigston, for Leicester, for the construction, completion and maintenance of the Whatstandwell to Belper section of the Derwent aqueduct, including the Ambergate reservoir.

THE Middle Ward district committee of Lanark County Council have agreed to apply to the standing joint committee for permission to borrow 6,000/ for the erection of sand filters at Glassford. It was also agreed to erect as an experiment two mechanical filters at Redleeshill.

FARRINGTON STREET, and especially the southern part, has developed of late in a remarkable way. For those who desire to erect a large building in so important a thoroughfare a suitable site will be offered for sale by auction on the 14th inst. It contains 22,000 square feet of clear space. Many years may elapse before a like opportunity again is offered.

THE roads and works committee of the Portsmouth Corporation have accepted the tender of the London Asphalte Company for laying about 18,000 square yards of asphalte at a cost of 8s. 9d. per square yard. One condition of the contract is that the roads shall be maintained in good condition for a period of five years, this being two years longer than was specified by the committee.

THE Isthmian Canal commission will hereafter have power to solve all questions relating to the canal without referring them, as heretofore, to Washington. The members of the commission will reside on the Isthmus and hold weekly meetings. The work is to be distributed so that each commissioner has charge of a certain department, for which he will be responsible. Lieut.-Col. Goethals, who succeeds John F. Stevens as chief engineer, will be chairman of the commission.

THE Birmingham education committee have accepted the report of the technical education and evening schools sub-committee, which recommended the acceptance of a tender for the purchase of a 50-ton testing machine for the Municipal Technical school. The sub-committee were of opinion that the time had arrived when the machine should be provided if the work of the school in the important subject of engineering was to be efficiently carried on. The machine was for the purpose of exhibiting to the students the strength of various materials. Its provision had been twice deferred in response to the wishes of the finance committee. It will cost 615/.

THE Local Government Board have approved the equating of the Bradford waterworks loans, regarding which an

inquiry was held some time ago. At present the water-works loans of the Bradford Corporation are spread over varying periods, and it was contended that it would be very advantageous to have an equation as compared with having to set aside a large sum over a short period and a small sum over a long period. Mr. G. A. Thorpe, the Bradford city treasurer, therefore, drafted a scheme for equation of the loans over a period of about sixty years, by which a sum of 20,000*l.* a year less will have to be put aside, thus affording considerable immediate relief to the ratepayers.

THE works committee of the Holborn Borough Council reported to the last meeting that they had received a proposal from the trustees of the Bedford estate for the formation of a new thoroughfare from Torrington Square to Montague Place, terminating in face of the new north front of the British Museum. The expenditure of the trustees of the British Museum on the purchase of contiguous land and on the enlargement of their buildings was estimated to reach 400,000*l.*, and if the scheme was accepted the trustees of the Bedford Estate would give up land to the value of about 70,000*l.* The committee stated that they proposed to submit specifications, &c., to the London County Council. The estimated cost of the work was about 10,000*l.*, 6,000*l.* of which would be borne by the London County Council and the balance by the Council. After discussion, the matter was referred back to the committee for further consideration.

THE waterworks committee of the Manchester Corporation, in the course of their annual report, make mention of the growing appreciation of the Corporation's hydraulic water supply, and the report adds:—"The demand is now nearly equal to the full capacity of the plant installed, and application has, with the approval of the Council, been made to the Local Government Board for additional borrowing powers in respect of the erection of another pumping station in Water Street, the site for which has been acquired. The work of construction will be commenced as soon as the necessary arrangements are completed and sanction given. The total number of machines agreed for is 1,974 and the total output of power-water for the year amounts to 232,278,100 gallons, 97 per cent. of which has been measured by the meters on consumers' premises. The total length of

hydraulic mains now laid is 20 miles 1,663 yards." The committee's revised scale of charges for water-power, which comes into operation at the beginning of next year, will, it is claimed, offer increased facilities for the use of the power and be of great advantage to small consumers.

AN interesting presentation of a silver tea and coffee service was made on April 30 to Mr. Charles E. Whitehead, one of the managing directors of Messrs. C. C. Dunkerley & Co., Ltd., Manchester, in recognition of his connection of half a century with the firm. In a short address preceding the ceremony, which was made in the presence of the other directors and the assembled staff, the chairman of the company, Mr. William Warburton, referred in terms of warm eulogy to Mr. Whitehead's services, and a suitable acknowledgment was afterwards made by the recipient. The tray, forming part of the service, bore the following inscription:—"Presented to Charles Edward Whitehead by his fellow directors, shareholders and the staff of C. C. Dunkerley & Co., Ltd., in commemoration of fifty years' service with the firm, and as a token of high esteem and regard. April 27, 1857—April 27, 1907."

MR. JUSTICE WALTON, in the King's Bench Division, gave judgment on Monday in the action of Chessum *v.* Macdonald & Hunt, which has been before the Court from time to time for weeks past. The plaintiffs, J. Chessum & Son, builders, of London, sought to recover 507*l.* odd from Messrs. Macdonald & Hunt, of Birmingham, on proper adjustment of accounts between the parties at the conclusion of a sub-contract let by plaintiffs to defendants for the plumbing and painting of certain artisans' dwellings at Dalston. Plaintiffs claimed that the actual settlement was made on an erroneous basis, arrived at in consequence of one of plaintiffs' clerks having mistakenly debited them with certain sums. Defendants originally denied all liability, but in February last, upon the decision of some of the points at issue by the judge, admitted liability for 389*l.* His Lordship, after allowing a contra account made by defendants, now gave judgment for plaintiffs for 409*l.* and costs.

THE Birmingham and District Housing Reform Council at their initial meeting last week adopted the following

objects:—To promote the study of the housing question and to assist the National Housing Reform Council in obtaining:—1. Alteration of by-laws: (a) To provide that in future building development of suburban districts such extra provision shall be made for air space as shall prevent the formation in them of new crowded areas; (b) to promote the universal adoption and practical employment of a by-law similar to the Birmingham by-law No 4c, which permits the local authority to reduce their requirement as to the width of the metalled portion of roads other than main roads, so as by lessening the cost of development of new building areas to allow of the building of decent working-class houses at a moderate cost. 2. New Legislation: (a) To empower the public authority to determine the position of main roads; (b) to provide for the adjustment of the by-laws of neighbouring public authorities as regards the planning of and building regulations in suburban districts; (3) to provide means whereby public authorities may, when necessary, purchase land without undue inflation of market prices.

THE York City Council have under consideration a proposed extension of the scheme for the bacteriological treatment of sewage, the additional work for which is estimated to cost 49,190*l.* 18*s.* The sewerage committee report that they are satisfied that the bacteriological treatment of the sewage is the better system to adopt in preference to the precipitation process hitherto in use. The experiments for the bacterial treatment of the sewage have been in operation for some time past and have proved satisfactory, and the system has been adopted within recent years by many corporations and other public bodies. The scheme of the city engineer in respect of these works provides for the following works being carried out, viz.:—(1) An automatic screening arrangement to be worked by the flowing sewage; it would be placed near where the sewage emerges from the bell-mouth pipe at the end of the rising main. (2) Widening the sewage channel so as to reduce the velocity of flow, and induce the deposit of sand and other mineral matter in a chamber to be constructed near the north-west corner of tank No. 1. (3) The conversion of the present six precipitation tanks into open septic tanks; and (4) the construction of twenty large and six small

filters six feet deep, having an area of 18,880 superficial yards, with supply pipes, circular distributors and effluent collecting channels. The total filter area, with the two existing filters, will equal 20,144 square yards. In addition to the above works and to meet the requirements of the Local Government Board, it would be necessary to provide streaming filters for storm water. They would be about three feet in depth below ground level, and cover a total area of 13,500 superficial yards.

INTERNATIONAL EXHIBITION AT MANNHEIM.

To celebrate the 300th year of the town's civic freedom, the municipal authorities have long had in preparation a jubilee exhibition of a novel description. The exhibition, which is under the patronage of the Grand Duke of Baden, will consist of an international display of art and of horticulture and floriculture, and the contributors to both sections comprise not only many of the foremost artists and men of science in the Fatherland, but also in other countries. A site on the Friedrichs Platz, comprising some ninety acres, has been allotted to the purposes of the exhibition. The exhibition will consist partly of buildings containing water-colours, paintings and sculpture by eminent artists, and, to a greater extent, of grounds beautifully laid out in a novel manner, in accordance with the ideas of artists, garden architects (a recognised profession in Germany) and leading horticultural firms. A portion of the grounds is divided into plots, which have been handed over to various experts to whom a free hand is given to carry out their own ideas of ornamental and practical gardening. The schemes comprise a natural amphitheatre formed by tiers of flowers, an old Roman garden, a garden of old-fashioned flowers, a model villa garden, a Japanese garden containing many rare tropical plants, a landscape formed with creeping and climbing plants, and a fine specimen of "carpet" gardening. There are two elaborate rose gardens, a well-equipped palm house and an orchid house; and among other prominent features may be mentioned the section laid out as a Black Forest landscape and the amusement park intended primarily for the frolics of young people. An imposing fountain in the grounds will be illuminated at night.

THE "SIGNET" Combined Range and Sitting - Room Grate.

Very suitable for Small Houses, Country
Cottages, Flats, &c. (Patented.)

Combines in itself in a **practical and efficient** manner
the essential features of a Cooking Range and Sitting-
room Grate.

*Many of these Grates are in use at Letchworth
and Cleveleys Garden Cities and elsewhere. Har-
monises with artistic surroundings and looks
well in any room. Size 38×38 inches.*

*Supplied when desired with High-Pressure
Boiler, also with artistic Cast-Iron Chimney-
piece. Goes into an ordinary fireplace like a
Register, very little building being required.
Well fitted and finished.*

Has been **THOROUGHLY TESTED** and has given
UNIVERSAL SATISFACTION. This Grate can
only be supplied through Builders' Merchants, Iron-
mongers, &c. Copies of unsolicited testimonials and
further particulars may be had from the Makers,

BUILDING IN EDINBURGH.

THE burgh engineer, in his report on the past year, says that as a gauge of the condition of the building trades, the returns of the Dean of Guild Court for the past year seem to indicate that the state of trade was no worse than in the year preceding, but the figures show rather a slight improvement in the total of work for which warrant was granted. The total number of warrants granted during the year was 769, compared with 739 for the previous year, the total estimated value of the work being 735,290*l.* and 681,515*l.* for these years respectively. In analysing the class of buildings and the figures which comprise these totals, a notable feature is the increase in the number (although not a corresponding increase in value) of self-contained houses for which warrants have been granted during the last four years, and a reduction in value of tenement houses within the same period. It would be premature to take this as a sign of the times, pointing to the ultimate extinction of the common stair dwellings, and the expansion of the system whereby each house will be separate and distinct from its neighbour and each family housed under its own roof, but there can be no question that there are many who desire to escape from the joint responsibilities and other drawbacks of the common tenement, for the greater privacy and advantages of a self-contained house. To meet this demand, an increasing number of small self-contained houses and "flatted villas" are being erected in the various suburban districts. These houses have generally the same accommodation as tenement houses, and have the benefit of a separate and distinct entrance, and in most cases the additional advantage of a private garden or green. Two storeys is the ruling height for this class of building, with separate houses on the ground and upper floors, and if the architectural features have the same characteristics as the ordinary tenement, they at least bulk largely to the eye, and have not the same barrack-like appearance as the four-storey block which has so long found favour, if not with the general public at least with the builder. With a minimum width of 60 feet between building lines, as now enforced, and buildings generally two-storeys high, "Newer Edinburgh" may present very different features from the older parts of the city. Turning

to the work certified as completed, the value totals at 527,465*l.* for the year 1906, compared with 483,376*l.* for the previous year. Villas, self-contained houses and property, however, figured out at 344,240*l.* for last year, as against 439,376*l.* for 1905, a reduction of 95,136*l.*, while the figures for public and other buildings amount to 183,225*l.*, an increase of nearly 140,000*l.* above the figures for the previous year.

The number of houses and other buildings for which warrants were granted in 1906 were as follows:—Villas, 60, 84,610*l.*; self-contained houses, 339, 240,200*l.*; public or other buildings, 144, 158,020*l.*; alterations, 548, 72,860*l.*; tenements of shops and dwelling houses, 65, 179,600*l.*—total, 735,290*l.*, as compared with the following figures for 1905:—Villas, 51, 73,800*l.*; self-contained houses, 264, 187,850*l.*; public or other buildings, 141, 179,952*l.*; alterations, 507, 34,673*l.*; and tenements of shops and dwelling-houses, 62, 205,240*l.*—total, 681,515*l.* The number of warrants granted in 1906 was 769, as compared with 739 in 1905, 862 in 1904 and 802 in 1903.

SMOKE PREVENTION IN FACTORIES AND ELECTRIC-SUPPLY STATIONS.*

COAL is a natural product which contains carbon, hydrogen, oxygen and nitrogen in some form of physical state and chemical combination which is not yet solved. For practical purposes coal may be regarded, however, as a mixture of solid carbon and gaseous hydrocarbons, and it is the latter, namely, the hydrocarbon gases—methane, ethylene, acetylene and others of the same series—which cause the difficulty in burning coal without smoke.

The solid or fixed carbon unites with oxygen before it rises from the bars of the grate as carbon dioxide or carbon monoxide gas, and once in this form it is never reduced within the furnace or flues to the solid state. The heat required to convert the molecule of fixed carbon into gaseous carbon is also supplied by the combustion of the next lying

molecule of fuel, and the combustion of the whole mass of fixed carbon is therefore progressive, and demands only two conditions, namely, an initial temperature of 700 degs. C., and an adequate supply of air above and through the mass of glowing fuel.

The hydrocarbon gases given off by all fuels on heating are much more troublesome to burn completely to carbon dioxide gas and aqueous vapour. These hydrocarbon gases vary from 6 per cent. in South Wales steam coal to 35 per cent. in the bituminous coal from the northern coalfields, and the difficulty of obtaining smokeless combustion is therefore greatest with the cheaper and more generally-used bituminous fuels. In the first place, the conversion of the solid carbon and hydrogen of the fuel into the gaseous state demands a large amount of heat, and this heat is necessarily drawn from the solid fuel lying on the bars of the grate, and not from the burning gases.

A great reduction of temperature occurs therefore during the gasifying process, and unless the addition of fuel be wisely controlled, the temperature of the furnace may be brought so low that ignition of these gases fails to occur, and the gases are then simply distilled from the coal, and pass up the chimney unconsumed, as a brown and choking vapour.

These hydrocarbon gases, when escaping unconsumed at a low temperature, do not liberate soot, but they are deleterious to health, and their suppression on that account is certainly called for. Moreover, they represent a large proportion of the total heat value of the fuel, and their escape unburned is not conducive to the economical working of the plant.

Taking an ordinary bituminous fuel of the following composition—70 per cent. coke, containing 10 per cent. ash and 60 per cent. fixed carbon and 30 per cent. volatile matter—we find that the fixed carbon in each pound of fuel burnt will produce 4,920 calories, while the volatile hydrocarbons will produce 2,859 calories, or 36 per cent. of the whole. To allow any portion of these gases to escape unburned is therefore a foolish waste of heat energy, and yet it is one which occurs regularly at the moment of firing in badly-managed boiler plant, especially when an unskilled man is in charge of the boilers. For the complete and yet economical combustion of these hydro-carbon gases as they

rise from the mass of fuel upon the bars of the grate three conditions are essential, namely:—

1. A temperature sufficiently high to cause the instant ignition of the gases. This is found by experiment to be about 670 degs. C.

2. A sufficiency of air, preferably heated, to combine with the carbon and hydrogen of these gases, but not a large excess of the same.

3. A good admixture of the air and the hydrocarbons. It is necessary not only that these conditions should be present initially, but that they should be maintained during the liberation of the hydrocarbon gases.

If the temperature be allowed to fall below 670 degs. C. the gases will not ignite, while if the air supply be deficient, or if the admixture be bad, only partial combustion will occur, and solid particles of carbon will separate, which will later coalesce to form smuts and soot. The chemical changes which lead to smoke formation may be represented for practical purposes by the following equations, although Bone and Drugman have shown by recent researches that the changes are much more complex than was formerly supposed:—

Methane.

Ethylene.

Acetylene.

Smoke is then caused, as a general rule, by failure to maintain conditions 2 and 3 of perfect combustion. When smoke is once formed, it is not possible on a large scale to secure its combustion, and only some form of smoke-washing apparatus will remove it from the chimney gases.

All the so-called "smoke-consuming" appliances are, therefore, mere devices to secure more perfect combustion of the hydrocarbon gases at the moment of their liberation, and in nine cases out of ten they do not involve any novelty of principle or of construction.

Practical Methods for Smoke Prevention.

The facts given in the preceding section of this paper show that the smoke problem is one which chiefly relates to the use of bituminous fuel, and that the perfect com-

Are you interested in WOOD PRESERVATION?

ANTHROL protects all varieties of wood from decay, whether the situation be damp or dry, and from the ravages of all wood-destroying insects, including the white ant on shore and the teredo in sea water. Rats will not gnaw wood which has been treated with

ANTHROL. Full particulars and prices will be sent on application.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The **ANTHROL** COMPANY, Kinning Park, GLASGOW;
and 6 Crosby Square, LONDON.

bustion of the other classes of fuels, liberating less than 15 per cent. of volatile hydrocarbon gases on heating, is not a difficult matter.

The furnaces originally designed and installed for boilers will, as a general rule, maintain the three conditions essential for perfect combustion with such fuels, and it is for this reason that in many of the London generating stations the high-priced South Wales steam coal is being used for steam-raising purposes, with notable effect upon the costs of supply.

The considerations advanced, however, show that bituminous fuel requires for its perfect combustion a large brick-lined chamber maintained at a temperature of from 700 degs. to 1,000 degs. C., in which the hydrocarbon gases and the heated air can mix thoroughly, and burn to CO₂ and H₂O, before they are allowed to come into contact with the water-cooled plates or tubes of the boiler. The size of this chamber must be proportioned to the volume of hydrocarbon gases liberated by the fuel, and therefore the character of the fuel supply ought to be taken into consideration when designing and erecting the boiler plant. If the furnace is to be hand-fired some automatic device is also necessary, whereby the draught is almost entirely cut off while the furnace door is opened for clinkering and firing purposes. When the firing is finished and the furnace door is closed, some mechanical device is again required for regulating the volume of air admission above the fire, and the period for which this secondary air admission occurs. Mechanical stokers with automatic and regular or continuous feed obviate this difficulty of an intermittent secondary air supply, and it is for this reason that they have become so popular in large steam-generating plants. Finally, with all systems of firing, the complete combustion of bituminous fuel demands some device for thoroughly mixing the heated air and hydrocarbon gases in the combustion chamber.

It is not my intention in this paper to give further descriptions of the methods by which bituminous fuels may be burned without smoke emission, and with high efficiency, in the furnaces of steam boilers and of heating apparatus generally. There are a large number of patented appliances and devices for attaining smokeless combustion now on the market. In so far as these embrace the features that have

just been described, they may be held to be useful, though the validity of the patents may in many cases be doubted. I have no hesitation in stating, however, that where these appliances are in use, though only relating to the maintenance of one of the three essential conditions, the emission of black smoke has been greatly curtailed if not altogether stopped.

A plant designed and erected in accordance with the whole of the practical recommendations given above would be capable of burning the cheapest types of bituminous fuel with high efficiency and with absolute smokelessness. I am hopeful that at a not very distant date I may be able to point to many such steam-generating plants in this country.

The Hamburg Smoke Abatement Society.

Two of the chief difficulties confronting the factory owner or station superintendent desirous of improving the work of his heating or steam-raising plant are those arising from lack of expert aid in its control and the scarcity of competent firemen. In large works a specially trained chemist or engineer is sometimes given the sole charge of the boiler-plant, with notable results as regards smoke abatement and economy, but in small works this plan is, of course, impracticable.

As regards the supply of competent firemen, this has always been deficient, and I have no hesitation in stating that a very large proportion of the smoke produced in this country is due to the low class of unskilled and untrained labour employed for firing the heating and boiler installations.

The Hamburg Smoke Abatement Society is a voluntary association of steam-users with works in or near to the city of Hamburg, which was formed in October 1902 for the purpose of assisting its members in the better management of their steam-raising plant. The work of this Society lies chiefly in the two directions indicated above. In the first place, a staff of engineers with special experience in boiler management is retained by the Society, and these advise and report upon the boiler installations of its members. Special steam-raising tests are carried out at regular intervals of time, and every effort is made to bring each boiler installation up to a high level as regards smoke-

lessness and efficiency. This solves the difficulty of "expert aid" for the small steam-user.

In the second place, the Society retains the services of two or more firemen instructors—these visit the different works of the members of the Society, as desired, and carry out a course of instruction for the firemen employed. In this way a body of competent firemen has been created in the city of Hamburg, upon which the members of the Smoke Abatement Society can depend for efficient stoking of their boiler plants."

A third direction in which the Hamburg Society carries out most useful work is in testing and reporting upon the value of new smoke abatement appliances or systems of firing. The Society possesses a small model steam-raising installation where these trials can be carried out under the supervision of its own staff of firemen and engineers, and the reports upon these trials, issued to its members, form another valuable feature of its activities. Further information about the work of the Society will be found in a paper contributed to the Conference on Smoke Abatement, held in London in 1905, and I may perhaps be allowed to quote here the concluding paragraphs of that paper:—

"The practical lesson which we in this country may learn from the above account of the work of the Hamburg Society is, I think, that the smoke problem is to be solved, like many another problem, by application of that old English method of self-help which is now sadly out of fashion. Manufacturers and fuel-raisers generally in this country must be taught that the emission of black smoke is largely preventable, and that the smokeless combustion of fuel promotes economy when carried out under proper supervision. It is for this reason that I have given instances from the annual reports of the Hamburg Society to prove the saving in fuel consumption which results from the working of steam-boiler plants on scientific lines, with properly trained stokers.

"What is wanted in this country is some society or organisation which will provide fuel-users with the technical advice and oversight required for obtaining the smokeless combustion of fuel in their own works. The Hamburg Society, in my opinion, is such an organisation, since it is showing manufacturers how to combine together to attack the evil at its source, namely, the boiler and heating instal-

lations in their own works. It would be well if similar societies were started in every large centre of manufacturing industry in this country."

Conclusions.

I shall not be surprised if I am told in the course of the discussion which is to follow the reading of this paper, that I have advanced no new theory to account for factory smoke, and have proposed no new plan or remedies for securing its abatement. This is perfectly true, more true, perhaps, than some of my critics themselves realise. The principles of smokeless combustion enunciated in this paper were first put forward by Mr C. Wye Williams, a Liverpool engineer, in the year 1839, and the following extracts from Williams's book, entitled "The Combustion of Coal," will prove to you that he had a fairly correct knowledge of what was required to secure smoke abatement:—

"It may be asked how it has happened that hitherto this (the smokeless combustion of fuel) has not been effected? I answer because the chemistry of combustion has been neglected, not in the laboratory, but in practice, and because the construction of our furnaces has been too much left to those who know little of the chemical properties of the materials which are consumed in them. . . ."

"A charge of fresh coal thrown on a furnace already in an active state, so far from augmenting the general temperature, or giving out heat, becomes at once an absorbent of it. . . ."

"I have proved during the last fifteen years that, even in the largest establishments and in the furnaces of steam boilers, the great nuisance of smoke may be avoided, and even with the accompaniment of considerable economy. . . ."

"In marine and cylindrical land boilers the combustion chamber is invariably made too shallow and too restricted."

Williams clearly pointed out that the combustion of bituminous fuel involved two distinct things, namely, the liberation and combustion of the volatile gases in a suitable chamber and the combustion of the solid coke on the bars of the grate. In one place he described how he proposed to put into practice these principles of fuel combustion, and showed drawings of boiler furnaces with properly designed and scientific arrangements for providing a secondary and heated air-supply behind the bridge. He was very sarcastic

at the expense of inventors, who even in his day were patenting devices for "consuming smoke," instead of attempting to show how to prevent its original formation.

The above extracts prove that this was altogether a remarkable book to have been written and published nearly sixty eight years ago.

Williams's book was reprinted in 1854 and 1886, but its teaching appears to have had little effect upon the practice of boiler engineers, who still persisted in designing and erecting boilers with wholly inadequate combustion space for the class of coal that was burned.

The results of trials carried out by the Manchester Association for the Prevention of Steam-Boiler Explosions in 1867-8 were similarly ignored by boiler-makers and their users, for here again it was proved conclusively that the bituminous fuels of the Wigan coalfield could be burned with high evaporative efficiency and without smoke emission under steam boilers, if proper attention were given to the design of the furnace, and to the control of the firemen and of the draught. The methods of attaining comparatively smokeless combustion and an evaporative efficiency of $9\frac{1}{2}$ lbs. of water per lb. of fuel in these Wigan trials were practically those recommended by Williams twenty-nine years earlier, and the chief novelty of Mr. Fletcher's report is the insistence upon the need for good stoking. In his opinion stoking was an art and should be treated as such, "and not as a slap-dash random process which any untaught labourer could accomplish."

The information I have placed before you to-night in my paper is then merely a restatement in more scientific form of the principles and practical recommendations contained in the writings of engineers who were studying and experimenting upon this subject during the mid-Victorian era. Is it therefore valueless as a practical contribution to the problem of smoke abatement? I think not. There is an altogether mistaken notion abroad that some new theory of combustion or some startlingly new form of steam generator is required before we can hope to reduce the emission of smoke in our factories and centres of manufacturing industry. No greater fallacy has ever entered the minds of engineers and hindered progress towards reform.

If the principles and methods described by Williams and Fletcher half a century ago, and redescribed by myself

in this paper, are recognised and properly carried out, bituminous fuel of the cheapest type can be burned to-day without smoke emission.

The clouds of black smoke which hang about and float away in inky streams from the chimneys of more than half the factories and electric-supply stations in this land are therefore simply an indication of the indifference or ignorance of the engineers who designed and supplied the heating and steam-raising plant.

With a properly designed plant, placed under expert control and manned by properly trained and skilled firemen, smokeless combustion is an assured consequence.

I therefore say that the production of smoke in the cases to which my paper refers is not only a waste of fuel, but is an unnecessary evil, and that it is an anachronism which reflects sadly upon our national want of thoroughness in the application of scientific principles to industrial practice.

KEYHOLD TENURE.

THE curious custom of keyhold tenure still prevails at Crowland, the abbey town in the Lincolnshire fens, where there are a number of cottages which are neither copyhold, freehold nor leasehold. They were originally built on waste land, and in each case the possessor of the key holds an undisputed tenancy. Although some of the occupiers have replaced the mud and thatched dwellings of antiquity with brick and slated buildings, they have no power to sell or will them away, for they have no deeds. On a tenant dying the first person to cross the threshold takes his place if he so desires. Many devices have been resorted to to obtain the keys. One man even went to the extent of dropping down the chimney of a cottage the tenant of which was dying. He watched the occupier's passing and then coolly took possession. Another obtained a mortgage on his cottage, and, after securing the money, laughed at the mortgagee and retained possession. The oldest keyholder has entered on his hundredth year. His name is Mark Wenham, and he has occupied his cottage sixty years without paying rates or taxes. The properties carry a county vote, but the Poor Law guardians always refuse to grant relief to the tenants.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

COMPETITIONS OPEN.

BIRKENHEAD.—May 17.—The Corporation of Birkenhead invite tenders for a central public library on a site fronting to Market Place South and Albion Street. The competition is limited to architects practising or residing within the borough. Premiums of 50, 30 and 25 guineas will be awarded by an assessor. Deposit one guinea. Mr. A. Gill, town clerk, Town Hall, Birkenhead.

IRELAND.—July 1.—The Kingstown Urban District Council invite competitive drawings for houses for the very poor. The first premium will be 100l. and the second 20l. The selected plans to become the sole property of the Council, and no further remuneration shall be paid to the architect should the Council decide to carry out the works themselves. Particulars may be obtained on a deposit of 1s. with Mr. M. A. Manning, town clerk, Kingstown, Ireland.

KINGSTOWN, CO. DUBLIN.—July 1.—For designs for buildings for housing the very poor. First prize 100l., second 20l. Particulars on payment of 1s. from Mr. M. A. Manning, town clerk.

WEYMOUTH.—July 30.—The Weymouth Town Council invite designs for a pavilion to be erected on the north side of the pier. One hundred guineas will be awarded for the selected design, such design to become the property of the Council. Mr. H. A. Huxtable, town clerk, Municipal Offices, Weymouth.

CONTRACTS OPEN.

ABINGDON.—May 31.—For building manual instruction and cookery centre at the Council school. Deposit 2l. 2s. Send names to the Secretary to the Education Committee, The Forbury, Reading.

BARDOLPH FEN.—May 22.—For the pulling-down of the present buildings and the erection of new chapel, school and other buildings, for the United Methodist Free Church, Rev. W. J. Christopher, Mount Pleasant, Downham Market.

BARNSELY.—May 15.—For the erection of two shops, Sheffield Road. Mr. Ernest W. Dyson, architect and surveyor, 10 Regent Street, Barnsley.

BEDFORD.—For alterations and additions to the Swan hotel. Mr. Thos. Thurlow, architect, High Wycombe, Bucks.

BIDDULPH AND BIDDULPH MOOR.—May 25.—For proposed Council schools to accommodate 708 and 306 children respectively. Deposit 2l. 2s. and 1l. 1s. Mr. Graham Balfour, director of education, County Education Offices, Stafford.

CALORIFIER.

BLACKBURN.—May 11.—For the erection of a new department to Cedar Street Council school, to accommodate 280 children. Deposit 2*l*. 2*s*. Messrs. Cheers & Smith, architects, 24 Richmond Terrace, Blackburn.

BODMIN.—May 13.—For the erection of a private residence and certain other works in Priory Avenue. Mr. William J. Jenkins, architect, Bodmin.

BRADFORD.—May 13.—For the erection of baths and wash-houses, Victoria Street, Bradford, for the Manchester Corporation. Deposit 3*l*. 3*s*. The City Architect, Town Hall, Manchester.

BRISTOL.—May 13.—For the construction and maintenance for twelve months after completion of the superstructure of an engine and boiler-house for the graving dock at the Royal Edward Dock, in course of construction at Avonmouth. Deposit 5*l*. Mr. W. W. Squire, engineer, Cumberland Basin, Bristol.

CARLISLE.—May 24.—For the erection of two attendants' houses—viz. one at Stanwix sewage-disposal works, one at Wetheral and Great Corby sewage-disposal works—for the Carlisle Rural District Council. Mr. Joseph Graham, engineer, Bank Street, Carlisle.

CHILSWORTHY.—May 16.—For the enlargement of Wesleyan chapel and new stable and carriage-house at Chilsworthy, Holsworthy. Mr. R. Cory, Chilsworthy, Holsworthy, Devon.

COVENTRY.—May 20.—For the old grammar school renovation and new classrooms. Deposit 1*l*. 1*s*. Mr. Herbert W. Chattaway, architect, Trinity Churchyard, Coventry.

CRANBROOK.—May 14.—For alterations at the police-station. The County Architect, 86 Week Street, Maidstone.

DARWEN.—May 14.—For the extension and completion of St. Cuthbert's, Darwen. Mr. C. H. Woods, architect, Albert Chambers, Darwen, Lancs.

DEVONPORT.—May 15.—For the work in the reappropriation of "E" Block as nursing sisters' quarters and administration block, Devonport Hospital, in the Southern Command, Plymouth Sub-District. Mr. Harry B. Measures, director of

barrack construction, War Office, 80 Pall Mall, London, S.W., on payment of 10*s*. (not returnable).

DODWORTH.—May 17.—For the erection and completion of three dwelling-houses in Keresforth Road, Dodworth, near Barnsley. Messrs. Crawshaw & Wilkinson, architects, 13 Regent Street, Barnsley.

EAST PRESTON.—May 13.—For addition of a room and other work at the infectious ward at the East Preston work-house, near Angmering station, Sussex. Mr. Harold M. Potter, architect, 41 Warwick Street, Worthing.

EGREMONT.—May 14.—For the masonry, joinery, plastering, slating, plumbing and glazier's work required in the erection of a shop and dwelling-house in Main Street. Mr. Norman Kitchen, architect and surveyor, Woodend House, Bigrigg, *via* Carnforth.

FENTON.—May 13.—For the builder's work required in the construction of public underground conveniences in Victoria Place. Mr. S. A. Goodall, surveyor, Town Hall, Fenton, Staffs.

GLASGOW.—May 18.—For the proposed alterations on the kitchen block and the nurses' dormitories, Belvidere hospital. The Office of Public Works, City Chambers, 64 Cochrane Street, Glasgow.

GLASGOW.—May 20.—For the supply and erection of riddle, mixer, elevator, &c., at St. Rollox refuse despatch works, Charles Street. Mr. D. M'Coll, superintendent of cleansing, 38 Cochrane Street, Glasgow.

GODALMING.—May 16.—For erection of municipal buildings and alterations and additions to the borough hall. Deposit 2*l*. 2*s*. Mr. J. H. Norris, borough surveyor, Bridge Street, Godalming.

GREAT YARMOUTH.—May 16.—For erection of dressing-rooms, new recreation ground, for the Town Council. Mr. J. W. Cockrill, borough surveyor, Town Hall, Great Yarmouth.

GREAT YARMOUTH.—May 11.—For the completion of St. James's Church. Send names to Messrs. Olley & Haward, architects, Queen Street, Great Yarmouth.

GUIST.—May 20.—For repairing the roof of Miss Packe's school, Guist. Mr. C. A. Hamond, Twyford Hall, East Dereham.

Nos. 2 and 3 TOTHILL STREET, BROADWAY, WESTMINSTER.

Telephone, No. 551 Victoria.

WOKINGHAM.—May 31.—For the building of a manual instruction and cookery centre at the Westcott Road Council school. Deposit 2*l*. 2*s*. Secretary to the Berkshire Education Committee, The Forbury, Reading.

WORSBOROUGH.—May 13.—For the carpenter and joiner, slater, plasterer, plumber and glazier, and painter's work required in erection of two houses on Mount Vernon Road. Mr. Arthur Whitaker, architect, Worsborough Bridge, Barnsley.

YARDLEY.—May 14.—For the erection of a Council elementary school in Church Road, Yardley, near Birmingham. Deposit 2*l*. 2*s*. Applications may be made on or before April 30 to Mr. Anthony Rouse, quantity surveyor, King's Court, Colmore Row, Birmingham. Mr. Arthur Harrison, architect, 109 Colmore Row, Birmingham.

WHITSUNTIDE ON THE CONTINENT.—Return tickets at reduced fares available for eight days will be issued to Brussels May 15th to 18th and 20th, *via* Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning after a comfortable night's rest on board the steamer. For visiting The Hague, Scheveningen (the Dutch Brighton) and Amsterdam for the old world cities of the Zuyder Zee, and the International Exhibition at Mannheim, special facilities are offered *via* the Great Eastern Railway Company's British Royal Mail Harwich-Hook of Holland route. A corridor train with vestibuled carriages, dining and breakfast cars is run on the Hook of Holland service between London and Harwich. From the Hook of Holland through carriages and restaurant cars are run in the North and South German express to Cologne, Bale and Berlin, reaching Cologne at noon, Bale and Berlin in the evening. For the convenience of passengers tickets dated in advance can be obtained at the Liverpool Street station continental inquiry and booking offices. The Danish Royal Mail steamers of the Forenede Line of Copenhagen will leave Harwich for Esbjerg (on the west coast of Denmark) on May 16th and 18th, returning May 21st and 22nd. The General Steam Navigation Company's steamers will leave Harwich on May 15th and 18th for Hamburg, returning May 19th and 22nd.

NEW CATALOGUE.

THE catalogue for 1907 relating to standard steel and reinforced concrete construction, from Messrs. D. G. Somerville & Co., differs from most others, inasmuch as they are prepared to carry out work in several selected systems besides their own. They give not only illustrations of various buildings in which reinforced concrete has been employed and tables relating to girders, stanchions, roofs, &c., but an introduction which is a succinct treatise on the work, and a standard specification which will be found suggestive to architects and engineers. The service and advice of a staff of engineers are at the disposal of clients, who can discover on consultation what arrangement is most eligible under particular conditions. At the works of the firm in Southall a stock of 10,000 reinforced concrete blocks is continually kept in a matured condition, in order that urgent contracts can be immediately carried out.

TRADE NOTES.

THE Yorkshire Fire Appliance Company of Leeds have received instructions to equip over twenty stations of the Great Northern Railway Company with the "Vanguard" hand chemical fire extinguisher, of which they are the sole makers.

THE Infectious Hospital, Falkirk, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

ARCHITECTS who have to design shops will recognise the utility of the catalogue of brasswork issued by Parnall & Sons, Ltd., Bristol. The very numerous varieties of brackets,

clips, stands, shelves, rails, suspenders are adapted to suit different classes of business. There are also electroliers and incandescent fittings of superior design.

THE British Fire Prevention Committee have published the report of one of their committees on a floor of reinforced concrete on the Herbst "Armocrete" tubular system. The system consists of a series of hollow concrete blocks of tubular form separated by webs of a section resembling the old cast-iron beam, consisting of Portland cement concrete in which is a wrought-iron corrugated bar. On the top of the blocks and webs concrete is laid and the soffit is rendered with plaster. The load applied was 280 lbs. per square foot. After the test it was found that the permanent deflection was less than $\frac{1}{2}$ inch, and neither fire nor water passed through the floor.

VARIETIES.

THE Southport Town Council recently offered premiums of 15 guineas and 10 guineas for the best two designs sent in for a two-sheet poster to advertise the town. So far only one design has been sent in.

THE Victorian Government contemplate making the port of Melbourne thoroughly up-to-date, and it is proposed to obtain the services of a leading British engineer in framing a scheme for this purpose.

A LOCAL GOVERNMENT BOARD inquiry was held last week into the application of the Manchester Corporation to borrow 102,000*l.* for meters and 54,000*l.* for mains and services, and 144,000*l.* on extensions at the Gaythorn and Bradford Road works.

MR. H. SHAW, of Huddersfield, has been appointed assistant sanitary inspector to the Scarborough Corporation in succession to the late Mr. W. B. Morton. The appointment is worth 100*l.* per annum rising to 120*l.* There were 365 applicants.

THE tramways committee of the Glasgow Corporation recommend that two members of the staff of the department be authorised to visit certain continental towns to get the fullest information on the subject of turbines, as it is proposed to introduce these for the additional power required at Pinkston station.

ENGINEERS AND SHIPBUILDERS' INSTITUTE, GLASGOW.

THE correspondent at Jerusalem of the *Revue Commerciale du Levant* reports that an Imperial firman has been issued for the construction of a new palace for the Governor and other officials in that city. The cost of the works is estimated at 940,000 piastres (about 8,460*l.*).

ARRANGEMENTS have been made with the contractors for the demolition of Tower Buildings by which the stone required for the building of new vestries at St. Mary's Church, Liscard, will be supplied therefrom instead of from Storeton Quarries as was originally intended. The Tower Buildings stone is the well-known Cefn stone.

H.R.H. THE DUCHESS OF ALBANY laid the memorial-stone of the Infants' Hospital, Westminster, on the 2nd inst. The elevation of the building is of red facings with Portland stone dressings. Messrs. Read & Macdonald are the architects and Messrs. Patman & Fotheringham, Ltd., of Theobald's Road, Holborn, and Park Street, Islington, N., are the builders.

THE London County Council on Tuesday resolved practically to abandon the scheme to supply electrical power to the county of London and large areas in the home counties. By seventy-four votes to thirty-nine the Council passed the following resolution:—"That the London County Council Electric Supply Bill be submitted for second reading in the House of Commons with a view to securing an arrangement under which private enterprise undertakes, subject to the control of the Council, the business of the supply of electrical energy, and on the understanding that such alterations as may be required in the Bill to effect this object and to deal with any other matters of importance which may arise on the Bill will be reported to the Council for its approval as soon as possible."

THE Great Central Railway Company have had two new turbine steamers constructed to meet the increased pas-

senger traffic on the Grimsby-Rotterdam route. As the journey will be performed in about eleven hours, men of business and tourists in the North of England will be on a level as regards accommodation with those in other parts of the country. The furnishing of these floating hotels is on a luxurious scale.

THE board of management of the Manchester Royal Eye Hospital, in Oxford Road, have placed the contract for the superstructure of the extension of the hospital with Messrs. C. H. Normanton & Co. It is estimated that the cost of the work will amount to about 23,000*l.*, of which sum about 11,000*l.* has been subscribed. Fifty additional beds for patients will be provided, making a total of 160 beds.

THE *Tramway and Railway World* states that the first contract for tramway permanent way for Japan, which has been placed in this country, has just been secured by a Sheffield firm. Hitherto orders of this kind for Japan have been placed with American firms, but in the present case, after keen competition, the British firm was successful. The contract provides for the supply and construction of the whole of the special trackwork, lay-outs, cross-overs, &c., required for the tramways to be constructed in Osaka.

THE London County Council last week adopted the following resolution by sixty-nine votes to forty-one:—"That so much of the resolution of February 5, 1907, as relates to the reference to the works committee for execution of the work of constructing the portion of the northern low-level sewer No. 2 between Stepney and Trafalgar Square be rescinded, and that it be referred to the main drainage committee to arrange for the issue of an advertisement inviting tenders for the work."

TO-MORROW (Saturday, May 11) the International Laundry Exhibition, organised by the Society of Engineers and Allied Trades and the Launderers' Association, will open at the Agricultural Hall, and will continue throughout the following week. Official visits are to be paid by the French, German and Dutch laundry associations, all of which are organising special excursions in connection with the event. There will be a large collection of machinery in motion, as well as of actual washing operations, while a competition for finished work will add to the interest of the exhibition.

W. & T. AVERY, Ltd., Soho Foundry, BIRMINGHAM.

The Dudley Town Council wish to borrow 6,000*l.* to be expended on paving works over three years. In addition, application is to be made to the Local Government Board for sanction to a loan of 4,021*l.*, of which 2,700*l.* is required to carry out a drainage scheme at Tividale, the balance being to cover the cost of the construction of sewers in various parts of the borough.

The housing committee of the Birmingham City Council have approved of the terms of the lease between the Birmingham City Council and the Ideal Benefit Society respecting the land originally acquired by the Corporation at Bordesley Green as a site for workmen's dwellings. The object of the Society in leasing the land is to erect houses for the working classes and establish a garden colony. The committee are asking permission of the Local Government Board to borrow 4,000*l.* towards making the roads and laying out the park, &c., and the Board will shortly send down an inspector to make an inquiry into the application.

An exhibition of urban cottages and homesteads for small holdings is to be opened on July 1, under the auspices of the National Housing Reform Council, at Letchworth Garden City. Some forty types of cottages are being built in groups and rows on a site within two minutes of the railway station. There will be a restriction of twelve houses to each acre, and with this number it will be possible to allow for common greens and children's playgrounds. It is intended to give opportunity of showing specimens of household furniture and fittings suitable for small houses and cottage homes, and it is proposed to allow a certain number of cottages to be occupied by one furnishing firm each. Diplomas and medals will be offered for the best single complete suites, and for the best specimens of houses furnished complete. In the small holdings section conditions have been established that may prove an economical success, under which the small holder may have the land on terms which he finds most suitable. The exhibition will remain open until September 30.

MR. MARCUS HOPKINS (the estate superintendent to the Swansea Corporation), as the result of a visit to the International Trades and Building Exhibition, has prepared a report in which he and the members of the Swansea housing committee who accompanied him say that in a borough handicapped as Swansea is by a code of by-laws

which regard both palace and cottage from the same point of view, a large number of the contrivances exhibited are debarred from use. Concrete slabs for walling, steel sheeting for partitions, and combination methods for house drainage and cottage dwellings could be manufactured at Swansea at a low price, and if sanctioned by the Corporation for building purposes much would be done in the way of solving the financial difficulty of the housing problem. The existing by-laws almost throttled any attempt to construct a cottage for it to be let at a sum a working-man could afford to pay, and yet produce an annual return sufficient to pay the interest on the capital invested and the sinking fund.

At the Building Trades Exchange, Sheffield, last week, the annual meeting of the Building Trades' Conciliation Board was held, there being present eight members representing the employers and ten representing the operatives. Mr. A. J. Forsdike presided and was unanimously re-elected president for the ensuing year. The meeting took into consideration the limitation of the boundary over which the Conciliation Board should have jurisdiction, and after some discussion it was decided that for the present the Sheffield city boundary should be considered as the area. It was shown that otherwise there would be the danger of overlapping, which might lead to difficulties, but an assurance was given on both sides that in the case of work beyond the city boundary in which any difficulty might arise the best endeavours of both would be exercised in arriving at an amicable settlement in the same way as in cases within the boundary over which the Board had actual control.

At the last meeting of the Presbytery of Dundee a letter was read from the Executive of the United Operative Masons' Association of Scotland complaining that a contractor for the church being built at Invergowrie was employing non-union labour, and did not pay the recognised standard rate of wages as established between the Dundee employers and operatives' associations. On two occasions attempts had been made to get the employer to come to an amicable understanding, but these had failed. The Rev. Dr. Grant said this was a matter in which the Presbytery could not interfere, and in declining to interfere he thought they should be careful to give no expression of opinion. They did not know but that there might be substantial

grievances, and he therefore thought the clerk should reply that they had nothing to do with the employment of the contractor.

HOLIDAY EXCURSIONS.—To those looking for a restful change from the present sphere of worry during the Whitsun recess the facilities set forth in the A. B. C. programme just published by the Great Central Railway Company will strongly appeal. It contains a mine of useful information suitable for all tastes and classes of travellers. Over 250 seaside and inland health resorts in the Midlands and the North can be reached in quick time by convenient trains, the visit extending over a week, for a sovereign or less. Week-end tickets are obtainable to a large number of places at low fares, and the choice of destination stretches from the Midland counties to the far North of Scotland. A fortnight's holiday may be spent in Ireland, and cheap fares are announced to Dublin (for the International Exhibition) and nearly one hundred other ports and inland places of interest. Other noticeable features of the programme are the frequent day and half-day facilities to the beauty spots of Middlesex, Herts and Bucks, bicycle and pedestrian tour tickets to many places of picturesque and historic interest, extension of the week-end tickets arrangement, &c. Continental trips may be taken to Belgium, Germany and the Rhine. The company's magnificent turbine steamers leave Grimsby every Tuesday, Thursday and Saturday at 6.30 P.M., arriving at Rotterdam early next morning. The ships are fitted with Stone Lloyd's system of watertight compartments, rendering them practically unsinkable. Copies of this comprehensive programme may be obtained free at Marylebone station, company's suburban stations, town offices and agencies, or from publicity department, 216 Marylebone Road, N.W.

ANCIENT LIGHTS IN BELFAST.

JUDGMENT has been delivered in the Irish Court of Appeal by the Lord Chancellor, Lord Justice Fitzgibbon and Lord Justice Holmes in the case of *Black v. Scottish Temperance Assurance Company*. It had been argued on an appeal by the defendants from various orders made by Mr. Justice Barton granting an injunction restraining the

defendants from continuing the existence of what was alleged to be a nuisance or legal obstruction to plaintiff's ancient lights in his woollen clothing factory in James Street, South Belfast. The interference was caused, says the *Irish Times*, by a lofty pile of buildings which the defendants had erected at a cost of about 60,000*l.* at the corner of Bedford Street and Donegall Square, immediately behind the new City Hall in Belfast, and which overshadowed to a large extent the plaintiff's smaller premises situated adjacent thereto. Subsequent to the original decree the defendants had faced the portion of their building from which the light was reflected to the plaintiff's premises with white glazed tiles, but it was contended on behalf of the plaintiff that this did not obviate the nuisance, and a mandatory injunction to remove the buildings was then issued.

The Lord Chancellor said the question mainly discussed on appeal was whether damages should be given by the defendants by way of compensation in lieu of the mandatory injunction awarded by Mr. Justice Barton. The plaintiff some years ago purchased for a sum of about 1,950*l.* premises on the north side of James Street, South Belfast. On the west side of plaintiff's premises there was a covered gateway and buildings belonging to a Mr. Ewing. A space of 15 feet separated these buildings from plaintiff's premises, and Ewing's buildings were only 36 feet in height. The defendants bought the site from Ewing in 1904 for a sum of 30,000*l.*, and they subsequently erected on this site at a cost of over 30,000*l.* the buildings now complained of. They occupied the vacant space of 15 feet, and the wall opposite plaintiff's premises was faced with red brick. At the trial this red brick wall was the main subject of complaint, though there was also evidence as to there being material diminution of light. The defendants went on with their building under the advice of their architect that no injury would be done, but also, no doubt, influenced by the fact that they had covenants in their title from the vendor. Everything appeared to have been done openly and *bona fide*. His Lordship referred to the evidence and to the judgments of Mr. Justice Barton in the matter, who obviously arrived at the conclusion that where the damages would be so considerable as 500*l.* he would not be justified in refusing a mandatory injunction. He (the Lord Chancellor) did

not think this could be a universal test to apply in considering the application of damages as a remedy instead of an injunction, though the amount of damages would always be an important factor. Where trading could and would be continued, as he thought it could be here, though with some inconvenience or dislocation of the business or expenditure in the alteration of a window or windows, then his Lordship thought the judicial discretion under the statute might, in the absence of special circumstances, be exercised to give full and adequate compensation in money for a pecuniary loss affecting a continuing trading while refusing the mandatory injunction. The tendency had lately been to give damages where that remedy would be adequate and consistent with the leaving of plaintiff in possession of his property. But no certain rule could be laid down for the exercise of the judicial discretion: it must depend upon the special circumstances of each case. The question here was, Could the injury, having regard to its nature, be fairly compensated by damages? He thought it could. The plaintiff was entitled to have those damages assessed by an inquiry, and the Court had neither the power nor the desire to deprive him of that right. The defendants had offered to leave the determination of the damages to the Court, and the sum of 500*l.* had been suggested as a liberal estimate. They could not, however, prevent the plaintiff seeking larger damages through an inquiry, but they could state in granting an inquiry that the defendants had offered this sum, and reserve the costs of the inquiry to be determined by the result. As regarded the costs of appeal, the defendants had served a notice of appeal which asked to have the action dismissed. That notice was wholly unsustainable, and therefore the defendants must pay the whole costs of the appeal.

Lord Justice Fitzgibbon said he entirely concurred with the opinion the Lord Chancellor had pronounced. His Lordship's main reason for thinking that money here would place the plaintiff substantially in as good a position as he was before was founded upon a very careful consideration of all the peculiar circumstances of this case. Literally, the great grievance of the plaintiff was that what was interfered with was the northern light. Considering what money could do, his Lordship thought the light to the examining-room could be increased to an extent greater

than it ever was before by the simple device of placing a steel girder across the wall and substituting glass for the brick partitions between the existing windows. There might also be a rearrangement of the premises in other respects by the judicious expenditure of money that would materially mitigate any inconvenience. An expensive scheme of works of mitigation had been carried out with the sanction of the Court and he did not think it fair that an experiment of that kind should be tried, and then, although there had been a very great mitigation of the damage, to hold that it had not carried it across the border of specific relief. The plaintiff would have an opportunity of considering whether he would accept the 500*l.* and his costs, offered by the defendants. If he went on and took an inquiry he would take it exactly in the same way as if 500*l.* had been lodged in Court. The damage might be a great deal less in the result.

Lord Justice Holmes also concurred. He said that in former times the relief given in such cases was an injunction to remove the cause, but Lord Cairns's Act directed that in some cases an award of damages would be the more appropriate remedy. But where the defendant had been guilty of misconduct or wanton disregard of the plaintiff's rights his Lordship would like to see the old form of remedy adhered to, and a mandatory injunction to pull down granted. Whether damages should be given in lieu of an injunction did not depend upon amount, but whether they would be full and adequate compensation. He would be glad if further litigation in this case were avoided by the plaintiff accepting 500*l.*, but he could not be deprived of an inquiry in which he might recover more, and he might just as likely recover less.

AMERICAN TERRA-COTTA.

THE manufacture of terra-cotta for the exterior of buildings grew to the fulfilment of a practical need. The steel structure of tall buildings arose, and with it, says the *Architectural Record*, the demand for a light wall to fill in the separate storeys, and shut in the enclosure from the outer air. The wall of the steel structure became in the eyes of the builder no longer a wall built as a structural mass, but a curtain

h, in accordance with the needs of construction, could
ung in the ninth storey or in the first, quite irrespective
he feeling that every wall must be built from the
nd up.

The hollow and the comparatively light terra-cotta
bright in addition to its advantage from this point of view
fity of multiplication in plaster moulds, and therefore
chpiness. It was also unfortunate enough to be made
in clay, and therefore in an infinity of tints. These
desive advantages also brought with them rigid conditions,
at how these were ignored every architect knows.

Because clay shrinks in the fire, and shrinks
irregularly and differently, terra-cotta is not cut stone,
at those who would use it as cut stone bring their
pishment down on their own heads, from which
ne abuse of the material can hardly be said to
pge them. Because burned clays can be made in hundreds
o shapes and tints, it does not follow that it is within
nufacturing possibilities to make it of any shade that
l suit the whim of the arbiter. So the paint-pot and the
tentine barrel became indispensable materials in the
ra-cotta shop, where their presence should never be
spected.

A clay product is one that is tried by fire, and the implied
contract in its use is that it can be tried in the fire again.
I that contract broken when it is put up in a building
ely painted with an oil paint and heavily loaded with
tentine to give it the soft dull tint of the native clays?

For years the difficulties attending the making of floor
ing from clays fixed the attention of the architect con-
stently on the question whether the slightest technical
quirement could possibly have remained unfulfilled.
he tiles were scrutinised not only with the straight-edge,
at they were laid in the floor under skirting lights to make
re that in this piece or that the slightest variation from
e true level did not exist. As it was known that no
vo pieces from the tiler's press had absolutely the
me shrinkage from fire, and as small variations in
e size can only be equalised in the cement joint
etween the tile, the product was measured and criticised,
ad the joints made the object of discussion until the
andard requirement was that the individual pieces should
ot vary from each other 1-32 of an inch in size.

Again the variation of shade in the fire became the
object of anxious solicitude. Over all these requirements
the fundamental one, which was not forgotten by the tile-
maker, namely, that the clay baked must be absolutely
matured and not be capable of scratching with a steel point,
was so completely forgotten (because so constantly met)
that it disappeared from the minds of the users as some-
thing to be thought of.

And now there comes a gentlemanly amateur from
Pennsylvania whose cultivated eyes detect that the hyper-
critical anxiety of the architect has robbed the tile wall and
floor of its individuality by reducing the joint to a hair, and
the colour of the surface to the monotony of paint. Playing
with that fascinating toy the fire, in its effect upon that fasci-
nating material which can be given any form by the hands,
he sees that the most interesting flashings and tints can
be produced by the most fusible clays at very low heats. He
takes these to the architect, who is unwilling to consider
anything thus far in the tile-maker's art but the complete
fulfilment of the rigid fetters into which his demands had
forced it. He is fascinated by the sports of the flame dis-
played by his amateur friend, and over his admiration he
forgets the fundamental requirements of the baked clay
tile, that it must be matured in the fire. He has always
forgotten this, and he forgets to take out his jack-knife and
try it upon the new sport that is recommended to his use.

It is needless to say that a year or two of wear of these
meretricious productions in the floor display that they are
not what they pretend to be. No one suffers but the client,
and he has paid his bills some time ago. Meanwhile it is
an ill wind that blows nobody good. If the architect will
allow a small proportion of the fascinating qualities which
are natural to that flame-burned product the "tile," he need
not sacrifice the meritoriousness of its durability if he will
but accept the meets and bounds of each of the qualities in
a rational degree.

ARTHUR L. GIBSON & CO.,
19, 20 & 21, TOWER STREET, UPPER SAINT MARTIN'S LANE, LONDON, W.C.

by Mr. Ernest R. Matthews, borough engineer of Bridlington, of which the following is an abstract:—

The author stated that he had been in communication with several American engineers respecting the design and construction of reservoirs, dams and other waterworks constructions in that country, and that he had received from them much valuable information which formed the basis of his paper.

He first gave a detailed description of the covering-in and improvement of the Natick, U.S.A., reservoir. Those works were designed by Mr. F. L. Fuller, C.E., Boston, U.S.A. Previous to the works being carried out the reservoir was an open one, and was a source of continual expense for cleansing. At the time of the covering-in its dimensions were as follows:—At top 217 feet by 212 feet, at bottom 159.8 feet by 154.3 feet, area covered in 44,730 square feet, capacity before covering (with a maximum depth of water of 17.22 feet) 4,340,000 gallons; with the same high water it is now 4,280,000 gallons. In 1902 it was covered in by groined elliptical arches in concrete at a cost of 9.50 dols. per cubic yard.

There are 169 piers, spaced 15.2 feet apart centre to centre. The elliptical arches have a span of 13 feet 6 inches and a rise of 2 feet 9 inches, the thickness at the crown being 6 inches. The concrete used was 7 to 1, composed of 1 part cement, $2\frac{1}{2}$ parts sand and $4\frac{1}{2}$ parts screened gravel. The floor of the reservoir is covered with 4 inches of concrete. The load on the piers is 18 tons to 19 tons to the square foot at the bottom. The total cost was 5,894/ 9s.

The author then submitted a tabulated statement relating to the construction of groined arches in connection with reservoirs and filters in America, which had been prepared by Mr. Leonard Metcalf, C.E., of Boston, U.S.A.

The author then described a small covered reservoir at Franklin, U.S.A., also designed by Mr. Fuller. The reservoir is circular, 46 feet in diameter, allowing a depth of water of 20 feet and having a capacity of 248,600 gallons. The wall is 3.5 feet thick at the bottom, 2.5 feet at the top and 22 feet high. This reservoir is built in concrete composed of 1 part cement, 2 parts clean sharp sand and $4\frac{1}{2}$ parts screened gravel. The roof is 10 inches thick at the springing and 8 inches thick at the centre, and has a

rise of 4.6 feet. To resist the thrust of the roof a steel band $14\frac{1}{2}$ inches wide and 1 inch thick, was inserted near the top of the concrete wall. The bottom of the reservoir consists of 6 inches of cement concrete. An electrical indicator shows at the pumping station the elevation of the water in the reservoir.

The author then described a covered reservoir at Louisville, U.S.A. This, he said, was a good example of modern American reservoir constructed throughout in reinforced concrete. The roof is of the groined arched type, the arches being approximately 19 feet span and 3.8 feet rise, the thickness of concrete at the crown being 6 inches and above piers 3 feet. The reservoir measures 460 feet by 392 feet and 394 feet, and it has a capacity of 25,000,000 gallons. The piers are 3.4 feet diameter and 21.11 feet high, and are placed 22 feet apart centre to centre. The concrete used was Portland cement concrete, 6 to 1.

The author then described a covered reservoir at Rockford, U.S.A. The reservoir measures 156.56 feet by 66.26 feet; the roof only is of reinforced concrete, the remainder of the reservoir being in ordinary concrete. The roof is a ribbed arch; the ribs increase in depth from crown to haunches, and are 7 feet apart. The reservoir is constructed in 7 to 1 concrete, and the cost was 18,500 dollars.

He then proceeded to describe a low buttress dam at Theresa, U.S.A., which was carried out in reinforced concrete, being a new departure in dam construction. It was designed by Messrs. Ambursan & Sayles, of Watertown, N.Y. It is 120 feet long by 11 feet high, and has a foundation on the solid rock. It consists of a concrete slope supported by concrete buttresses, the former being 6 inches and the latter 12 inches in thickness, the buttresses being placed 6 feet apart centre to centre. The whole is reinforced by $\frac{3}{4}$ -inch Thacher steel rods and expanded metal. The buttresses and toe are of Portland cement concrete 9 to 1, and each buttress is bolted down to the rock by $1\frac{1}{4}$ -inch bolts 3 feet in length.

The author finally described a special high-pressure fire service main which has been laid in the city of Providence, U.S.A., the leading features of which are the design of the joints, the method of securing the pipes where laid on the curve, and the method of securing the branch pipes.

THE INSTITUTION OF CIVIL ENGINEERS.

the annual general meeting of the Institution of Civil Engineers, held on Tuesday evening, April 30, the result of the ballot for the election of officers was declared as follows:—President, Sir William Matthews, K.C.M.G.; vice-presidents, Mr. W. R. Galbraith, Sir E. Leader Williams, J. C. Inglis and Mr. G. H. Hill; other members of Council, Mr. J. A. F. Aspinall (Liverpool), Mr. J. Benton (India), Mr. B. H. Blyth (Edinburgh), Mr. C. A. Preton, Mr. R. Elliott-Cooper, Col. R. E. B. Crompton, C.B., J. Davis (Sydney, N.S.W.), Dr. G. F. Deacon, Dr. F. Ear, Mr. M. Fitzmaurice, C.M.G., Mr. R. A. Hadfield (Effield), Dr. C. A. Harrison (Newcastle-on-Tyne), Mr. J. Hobson (Montreal, Canada), Mr. W. Hunter, Mr. G. R. Jebb (irmingham), Mr. J. H. Johns (Johannesburg, Transvaal), Wm. Thomas Lewis, Bart. (Aberdare), Sir George T. Resey, Mr. A. G. Lyster (Liverpool), Mr. A. Ross, Mr. H. Ryan (Dublin), Mr. A. Siemens, Mr. J. Strain (Glasgow), Professor W. C. Unwin, Mr. W. B. Worthington (Derby) and Mr. A. F. Yarrow. This Council will take office on the 1st Tuesday in November 1907. The Council have made the following awards for papers read and discussed before the Institution during the past session:—A Telford gold medal to Mr. Dugald Clerk; a Watt gold medal to Mr. James Tyler Milton; a George Stephenson gold medal to Mr. George Andrew Hobson; Telford premiums to Messrs. Charles Frewen Jenkin, William Archer Porter Tait (Edinburgh), Alexander Pelham Trotter and Moses Kellow (enrhyndeudraeth).

NON-INFLAMMABLE WOOD.

The American Consul at Bordeaux has described some experiments witnessed on the public square, the Quinances, where the International Maritime Exposition in commemoration of the hundredth anniversary of Fulton's successful application of steam to navigation is to be held. Warned by the fire at the Milan Exposition, in which valuable paintings, tapestries and other works of art were destroyed, the deputy commissioner-general devoted much of his time to the study and investigation of the different methods of rendering wood, paper, silk, cotton and woollen

stuffs non-inflammable. Of all the formulæ submitted he decided to experiment with the following:—Sulphate of ammonia, 135 grams; borate of soda, 15 grams; boric acid, 5 grams; and water, 1,000 grams. The exhibition consisted of treating pine shavings, wood, paper and cotton fibre with this preparation, and after a thorough drying applying the fire test.

A huge pile of shavings, pine kindlings and wood was set on fire, and in the blaze were thrown shavings and sticks of wood impregnated with this "ignifuge." When the fire had exhausted itself the impregnated shavings and wood were found to be simply blackened and charred; they gave out no flame. Paper and cotton fibre treated with the same solution when exposed to the flames consumed very slowly without a blaze. So successful and conclusive seemed the demonstration that orders were given that all wood and timber used in the construction of the exposition buildings, and all cotton, canvas and linen stuffs, carpets and rugs employed in the furnishing thereof, should be treated with this "ignifuge."

Afterwards there was an application of the liquid to some heavy timbers, which were quickly and effectively treated by the workmen, who directed streams of the preparation from receptacles strapped to their backs. In addition to the precautionary measures adopted, the fire department will have all the exposition buildings under close and constant inspection. The buildings now being constructed are on the river front, so that abundant supplies of water will always be available.

REVIVAL OF THATCHING.

THATCHED roofs are now becoming very prominent, says the *Philadelphia Record*, and it is a question whether the Pennsylvania German ancestors are responsible for instilling in the hearts of their descendants love for the quaint building methods of the Fatherland, or whether it is a mere following of the popular fad for introducing Japanese gardens on extensive estates.

Certain it is that much of the roofing of summer-houses and other garden retreats is decidedly Dutch in design, being characteristic of the picturesque thatching that attracts the attention of the traveller in the vicinity of Rotterdam

and throughout the country districts of Holland, while other quaint roofs of thatch are distinctly Japanese in design.

For the thatching various materials are employed. For the commonest work straw is used; better kinds of thatch are made of long meadow grass, and there is a tough kind of reed used for this purpose, and also a certain species of rush. The roof requires no special preparation to receive the thatch, save that the rafters and framework shall be close enough together to receive it.

The thatch is formed in suitable masses, combed with the fingers and otherwise arranged so that the straws all point in the same direction. These masses are then secured and bound down to the roof by long poles, which are afterwards removed. While the thatch is bound down in this way it is beaten into place by a wooden mallet. The thatch is then trimmed into shape by a pair of long-handled shears. This is only the barest outline of the process of thatching, and the methods differ slightly according as to whether the Dutch or the Japanese thatches are copied. When a roof is finished it presents a clean, trim and symmetrical appearance, which seems surprising when the nature of the material is considered. The eaves are trimmed off square or slightly rounded and are often very thick, being sometimes 2 feet or more in thickness. This does not indicate, however, that the thatch is of the same thickness throughout. The thatch seen in these various ways is thus seen in sections, and sometimes by way of contrast there will be successive layers of light and dark thatch.

While a good deal of skill and patience are required to thatch a roof evenly and properly, vastly more skill will be required to finish the ridge, which is often very intricate in its structure, especially when Japanese methods are followed. In some types taken from the Japanese plans vertical ridge poles are seen with their ends freely projecting beyond the gable, and wrought in a gentle upward curve, and this style is effective in giving a light and buoyant appearance to what might otherwise appear heavy and commonplace.

A roof is sometimes seen which shows the end of a round ridge-pole projecting through the thatch at the gable peak, and at this point a flat spur of wood springs up from the ridge, to which is attached at right angles a structure made of plank and painted black, which projects 2 feet or

more beyond the gable. This appears to be a survival of an exterior ridge-pole, popular in the early days of Japanese architecture.

Ridges composed of tile are also popular in the no forms of thatch found on American country seats. The construction of this kind of ridge is very simple and effective; semi-cylindrical tiles are used for the crest, and these in turn cap a row of similar tiles placed on either side of the ridge. The tiles are sometimes bedded in a layer of cement or mortar (in Japan a layer of clay or mud or chopped straw is used), which is first piled on to the thatched roof, and when laid in this the tiles are seldom displaced.

In the best types of thatching special attention is given to the proper and symmetrical trimming of the thatch the eaves and at the edges of the gable, and there are very clever ways in which this is managed. Sometimes at the peak of the gable a conelike enlargement of a circular depression is curiously shaped out of the thatch, and a good deal of skill is also shown in bringing the thick edges of the eaves, which are on different levels, together in graceful curves.

In some of the bark-walled summer-houses a novel bark finish is also found in the roof-thatching. The ridge pole which has a much sharper incline than the roof proper, covered with bark, this being bound down by parallel strips; and spanning the ridge at intervals are straw saddles sheathed with bark. These are very narrow at the ridge, but widen at their extremities.

A strikingly decorative feature of some of the thatched roofs of Japan should be more widely copied; in many cases the ridge is flat, and this area is made to support a luxurious growth of iris or the red lily. A most charming feature is often seen in the appearance of a brown, sombre coloured village in Japan, where all the ridges are aflame with the bright-red blossoms of the lily, or where the pure colours of the blue and white iris form floral crests of exceeding beauty. This is a feature that might be introduced with strikingly picturesque effect for finishing the decorative thatched roofs of American gardens.

Another style of roof, sometimes of circular form, has the thatch on the slopes of the roof trimmed in such a way as to present the appearance of a series of thick layers

ing one upon another like shingles, in some instances 18 inches to 2 feet apart, with thick edges. Again the ar, evenly trimmed layers are very close and regular. d example of this style of roof finish is found on the son estate, at Glenwood Summit; and roofs of the thick, shingle-like thatching are also found in square on some of the decorative garden houses of near-by ury seats.

is a matter of surprise to the uninitiated to discover along these roofs will remain in good condition. Even unskilled thatching, merely for garden decoration it is ad that a roof may be depended upon to last from 15 to ears with very little repairs; and it is said that in the best kind of thatched roofs will endure for fifty . As they get weather-worn they are often patched repaired until they have to be entirely renewed. In and in many of the thatched roofs of France and and the oldest roofs are the most decorative, as they me filled with dust, assume a dark colour and get ad down. Plants, weeds and mosses of various kinds grow upon them, as well as masses of gray lichen, h cover the entire roof slope. And where the effect antiquity is desired in the quaint forms of thatching popular among Pennsylvania landscape gardeners, weather-worn, lichen-covered type might be readily uted.

When properly constructed these thatched roofs shed r very promptly and do not get water-soaked, and efore prove serviceable as well as decorative.

STATUES OF BEVERLEY MINSTER.

VEEN 1897 and 1901 sixty-nine statues were placed in exterior niches of Beverley Minster, mostly in com- oration of the sixtieth year of the reign of the late Queen oria. The trustees of the minster agreed to find and ide the stone, the scaffolding and the cost of fixing, and money expended on the entire work amounted to 1,540l. after all this was done, there still remained 143 niches e filled, and Canon H. E. Nolloth, the vicar, has now ertaken at his own cost, says the *Yorkshire Herald*, to e some thirty statues in the niches of the west front.

Mr. R. Smith, a well-known London sculptor, who carved all the other figures which now adorn the exterior of the edifice, has already made a good start with the work. He has completed statues of the twelve Patriarchs, which are, to be placed in the twelve niches above the west door.

In several instances the canopy heads of the niches have become woefully decayed, and the trustees are now re- storing those over the west front niches. Mr. J. Baker, of Upper Tooting, London, is engaged on the work of restoring these in harmony with the canopy heads, which are still in good repair. Ketton stone is being used for the figures, whilst the canopy heads are being carved from Tadcaster stone.

At the east end below the arch of the window are statues of King Athelstan, who gave a charter to the church in A.D. 937, and of St. John of Beverley, both of them being ancient figures which existed before the present work of restoration began. In the niches in the west face of the north tower stand a large number of figures representing Biblical and historical characters. The following list, with the names of donors, will be of interest:—

Lucius, King of Britain, legendary founder of Beverley Minster, A.D. 157—Mr. John Woodcock, in memoriam of Miss Margaret Woodcock.

Edwin, King of Northumbria—Mrs. Crust.

St. John of Beverley, Bishop of Hexham, 687—Guild of St. John of Beverley.

Eborius, first known Bishop of York, 314—the Arch- bishop.

St. Hilda, teacher of St. John of Beverley—Mrs. H. E. Nolloth.

Brithunus, first Abbot of Beverley, died 733—Historical Society of Beverley, Mass., U.S.A.

Coiffi, the last High Priest of Thor, A.D. 627—Historical Society of Beverley, Mass., U.S.A.

Walter L'Espece, founder and Abbot of Rievaulx—Mr. S. E. Todd.

The Venerable Bede—Mrs. H. Nolloth.

Thomas à Becket, Provost of Beverley—Rev. C. F. Nolloth, in memoriam of Captain H. O. Nolloth, R.N.

Archbishop Melton, 1316, built west front of York and aided in the restoration of Beverley Minster nave—Lord Grimthorpe.

King John, who gave a charter to this church in 1204.

Ralph de Totinhall, bailiff of Beverley, 1282.

Winwald, second Abbot of Beverley, A.D. 733—the Vicar.

Queen Eleanor, who in 1272 visited Beverley Minster—the women of Beverley.

King Edward I., who thrice visited the shrine of St. John of Beverley in this minster—Mr. J. J. Head.

Queen Margaret, visited Beverley Minster in 1303.

Archbishop Kinsius, 1050, built a high tower to the minster and placed in it two great bells—the Vicar's Men's Bible Class.

Coming now to the west face of the south tower we find the following statues:—

Queen Ethelburga of Kent, who married Edwin—Mr. J. A. Hudson.

King Athelstan, a benefactor of this church—Miss E. Raguenau.

Paulinus, Bishop of York, 627—the Rev. James Palmes.

St. Wilfrid, Archbishop of York, A.D. 665—Mr. and Mrs. Chater-Fawsett.

John de Hotham, Bishop of Ely, 1316—the Lord Hotham.

St. Augustine of Canterbury—A. B. Reckitt.

Siward, Earl of Northumbria—James Mills.

Gilbert de Grimsby, bore the banner of St. John to Scotland, 1299—"An Old Choir Boy."

St. Gregory the Great, impelled by seeing the boy captives from Holderness to desire the conversion of the Angles—Miss M. Woodcock.

John de Wyclif—Miss Maria Woodcock.

King Henry IV., who visited Beverley.

King Edward V., who came to return thanks after Agincourt to this minster—the Vicar.

Queen Catherine, who came with Henry V.

King Edward VI.—Mr. J. E. Elwell.

John Fisher, Bishop of Rochester, educated at the school of this minster, beheaded by Henry VIII.—Mr. W. H. Fisher.

In the final over the west door is a statue of St. John the Evangelist (patron saint) given by Mrs. Thomson Foley.

In the north face of the tower stand figures representing:—

Alghfrid, King of Northumbria, who made St. John of Beverley Bishop of Hexham in 687—Mrs. R. Warton.

King Edward the Confessor, who gave a charter to Beverley—Mrs. W. H. Rigg.

Archbishop Wickwane (donor of Figham)—the Freeman of Beverley.

Archbishop Neville (donor of Westwood)—the Freeman of Beverley.

St. Alured of Beverley, Chancellor of the minster and Abbot of Rievaulx.

St. Cuthbert of Durham—Mr. and Mrs. Newbald.

Edward the Black Prince, who came to Beverley Minster in 1300—Mr. J. Willis Mills.

Henry Percy. This is one of the three ancient figures.

Queen Victoria—the Women of Beverley.

King Edward VII.—the Freemasons of Beverley.

William of Wykeham, Canon of St. Mary's, 1361—the Vicar.

St. Etheldreda, wife of Cyfrid, King of Northumbria.

Edward III., who visited the shrine of St. John—Robert Warton.

Queen Philippa—Miss Warton.

Archbishop Thomas of Bayeaux, founder of the Provostry here—the Vicar.

Herebald, Abbot of Tynemouth, a disciple of St. John of Beverley—Miss Warton.

On an adjacent buttress stands a statue of St. Katharine to whom there was formerly a chapel in the minster. It was presented by Mr. J. T. Cussons. In the centre pinnacle of the north porch we have a herald angel represented, and a figure of St. John the Baptist presented by Miss Maria Woodcock. A statue of Our Lord enthroned presented by Col. Cussons, J.P., stands in the battlement as well as figures representing St. Bartholomew, St. Thomas, St. James the Less, St. Andrew, St. Peter, St. Paul, St. James the Great, St. Philip, St. Matthew, St. Jude and St. Matthias. On the south side of the portal are the patron saints of the four Beverley parishes—St. John the Evangelist, St. Nicholas of Myra, St. Mary the Virgin and St. Martin of Tours.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

IRELAND.—July 1.—The Kingstown Urban District Council invite competitive drawings for houses for the very poor. The first premium will be 100l. and the second 20l. The selected plans to become the sole property of the Council, and no further remuneration shall be paid to the architect should the Council decide to carry out the works themselves. Particulars may be obtained on a deposit of 1s. with Mr. M. A. Manning, town clerk, Kingstown, Ireland.

KINGSTOWN, CO. DUBLIN.—July 1.—For designs for buildings for housing the very poor. First prize 100l., second 20l. Particulars on payment of 1s. from Mr. M. A. Manning, town clerk.

WEYMOUTH.—July 30.—The Weymouth Town Council invite designs for a pavilion to be erected on the north side of the pier. One hundred guineas will be awarded for the selected design, such design to become the property of the Council. Mr. H. A. Huxtable, town clerk, Municipal Offices, Weymouth.

CONTRACTS OPEN.

ABINGDON.—May 31.—For building manual instruction and cookery centre at the Council school. Deposit 2l. 2s. Send names to the Secretary to the Education Committee, The Forbury, Reading.

ALCESTER.—May 27.—For the erection of stabling, &c., at Astwood Bank. Mr. Bernard Perrins, Central Chambers, Redditch.

BARDOLPH FEN.—May 22.—For the pulling-down of the present buildings and the erection of new chapel, school and other buildings, for the United Methodist Free Church. Rev. W. J. Christopher, Mount Pleasant, Downham Market.

BIDDULPH AND BIDDULPH MOOR.—May 25.—For proposed Council schools to accommodate 708 and 306 children respectively. Deposit 2l. 2s. and 1l. 1s. Mr. Graham Balfour, director of education, County Education Offices, Stafford.

LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

6-11 Imperial Buildings,

Ludgate Circus, London, E.C.

WOLVERHAMPTON.—May 21.—For certain work at the workhouse, Heath Town, in connection with the excavation of the present foundations of the boiler-house and the laying of a new foundation for four boilers, including the necessary removal of the boilers and their refixing, &c. Mr. Frank Harrison, clerk, Union Offices, Wolverhampton.

WORKINGHAM.—May 31.—For the building of a manual instruction and cookery centre at the Westcott Road Council school. Deposit 2*l.* 2*s.* Secretary to the Berkshire Education Committee, The Forbury, Reading.

ONE of the most interesting events of the year will be the offering by auction by Messrs. Knight, Frank & Rutley, in September, of the well-known Middleton Evans estate at Llandrindod Wells—the premier health spa of Wales—which embraces the greater part of the town and includes the famous Pump House Hotel, with its magnificent rooms, bath-house, pump-room and lovely timbered grounds. The medicinal springs of saline, chalybeate and sulphur which rise on the estate were discovered early in the seventeenth century, but their value and healing powers were not brought so prominently before the medical profession until some twenty years ago. Now the waters have become a household name, and coupled with healthy climate, rural surroundings and charming undulating country there is no wonder that Llandrindod Wells is growing more in favour each year as the leading and most select health spa of Britain. There are the lovely heather-clad downs, excellent golf links 1,000 feet above sea-level, beautiful drives and walks in all directions and good fishing in the river Ithon. Every care has been taken in laying out Llandrindod Wells, and the estate now proposed to be offered will be submitted first as a whole (about 700 acres with the Pump House Hotel), and if not sold, in lots of sufficient size to form unusually attractive building estates with long frontages to main roads. The property will also be sold with possession (except the Pump House Hotel, which is let on lease) and free of tithe and land tax, and an opportunity presents itself of acquiring some really fine sites suitable for the erection of country mansions, hydros, hotels, scholastic institutions, or to form choice building estates, the land being ripe for immediate development.

THE new South-Eastern hospital erected to the plans of Messrs. T. W. Aldwinckle & Sons, architects, London, has been ventilated on the "Boyle" natural system, this system having been successfully employed in the old hospital.

MESSRS. W. & T. AVERY, LTD., of Birmingham, have issued a catalogue of their bankers' scales, bullion balances and platform scales and other important appliances. That such delicate measures can be produced by manufacturers of weighing machines for the heaviest loads is remarkable, and suggests the perfect and comprehensive organisation of Messrs. Avery's establishment.

It was decided at a meeting of the clock committee of the South Luffenham Church, near Stamford, last week, to erect a new clock in the tower from the plans of Lord Grimthorpe, and that Messrs. W. Potts & Sons, Ltd., should be entrusted with the work. Messrs. Potts are also making the Lord Cranbrook memorial clock for Low Moor, Bradford, Yorks, and one for Mr. Claude Leatham, J.P., for Castleford Market.

An interesting piece of renovation is being carried out by Messrs. Farnham, Ltd., of Caxton House, Westminster, on a Georgian building in Portland stone and brick at 19 Stratford Place, Oxford Street, under the supervision of Mr. Lewis Solomon, F.R.I.B.A., of 16 Union Court, Old Broad Street, which has been acquired by the German Athenæum Club. An inspection will no doubt be of interest to architects, as it furnishes a conspicuous example of the Farnham methods. Dirt deposits of 150 years have been removed from the stonework, which is now being restored to its original colour, and as the treatment is entirely a dry one and no chemicals have been used, this pleasing effect has been secured without injury to the fabric.

An offer was received from Mr. Glyn Vivian, of Swansea, to erect an art gallery in the town and present also the nucleus of an art collection, on the one condition that the burgesses undertook to maintain it. The Corporation agreed to accept the gift, but a few burgesses demanded a poll to be taken on the question of increasing the library rate by a farthing in the pound. Mr. Vivian has, in consequence, withdrawn his offer.

ELECTRIC NOTES.

MR. T. W. BLOXHAM, who has been assistant engineer to the Belfast electric-lighting station, has been appointed city electrical engineer at a salary of 500*l.* per year, in succession to Mr. V. A. H. M'Cowen, who now has charge of the Salford electrical works.

THE Southport electricity committee have received the resignation of Mr. R. S. Downe, the borough electrical engineer, who has served the Corporation for the past six years. Mr. Downe has been appointed general manager of an industrial concern. Previous to going to Southport Mr. Downe was first assistant in the Liverpool electric supply department. The position at Southport is worth 500*l.* a year, together with the privilege of having two premium pupils.

THE Dundee Town Council, after protracted negotiations with the Harbour Trustees on Friday came to an agreement for a site on the river frontage for the new electrical undertaking. The ground, extending to 160 poles, is taken on perpetual lease, the feu duty being 12*s.* 6*d.* per pole, and this working out at a total of 100*l.* per annum. The trustees wished to charge a duplicand, but the Town Council representatives refused to consent. The erection of the new electrical station will be at once commenced, and it is hoped that it may be sufficiently far advanced to undertake a part of the heavy load of next winter.

THE electricity committee of the Wolverhampton Town Council recommend the raising of 45,000*l.* extra capital to enlarge the generating station works and the laying of new mains in the town. They have already made a contract with Messrs. Bayliss, Jones & Bayliss to supply electricity to their works for motive-power and lighting purposes. To do this will require the expenditure of 16,000*l.* for new engines and boilers. Other consumers are applying for power and light, and the committee consider it advisable to provide for additional works while the required extensions are in hand.

THE borough surveyor of Bournemouth has submitted a scheme to the Town Council for planting next autumn about 116,000 pine trees and 17,000 rhododendrons, at an estimated cost of 1,900*l.*

THE death is announced of Mr. Harrison Hodgson, C.E., of Workington, who carried out many railway and engineering contracts in South Africa and South America.

THE Union of Building Trades of Berlin has decided unanimously to lock out all masons, carpenters and builders' labourers on Whitsun Saturday. Some 100,000 men will be affected.

THE District Council of Trim, co. Meath, intend to apply to the Local Government Board for authority to erect cottages of concrete blocks. An ordinary cottage in the district would cost 185/. But in the Dublin exhibition was one of concrete costing 145/.

THE memorial of Sir Hector MacDonald at Dingwall, Ross-shire, which is the outcome of an appeal initiated by the Clan MacDonald Society in Glasgow, is to be opened by Lord Tullibardine on Thursday next. The memorial takes the form of a tower in the Scottish baronial style of architecture, 100 feet in height and 350 feet above the sea level.

AN international exhibition of arts, crafts and manufactures in Madrid has been organised, and will be held during the coming autumn in the Spanish capital. The classification of the exhibits embraces all branches of manufactures, arts and industries. It is expected that British exhibits will attract considerable attention.

THE Tunstall Urban District Council have received twenty-three tenders for extensions at the sewage works,

the amounts of the tenders ranging from 10,637/ to 7,375/. It was resolved that the three lowest tenders—by T. Goodwin, Tunstall, 7,375/; F. Mitchell & Son, Manchester, 8,053/, and J. Bentley, Bradford, 8,219/—be submitted to the engineers to check details and report.

THE general board of studies of Cambridge University are about to appoint a reader in forestry for a period of five years. The annual stipend is 400/, and the reader is to devote himself to research and the advance of knowledge in his department, and will be expected to advise the forestry committee of the Board of Agriculture studies on the technical subjects.

THE Japanese Government have, it is stated, placed orders with the American Bridge Company for no fewer than 468 steel span bridges required in connection with the Manchurian railway, and also a contract for locomotives with Messrs. Burnham, Williams & Co., of the Baldwin Locomotive Works, Philadelphia. It is stated that the orders were secured in face of European competition and on a promise of prompt execution.

THE Cardiff United District of the National Amalgamated Society of Operative House and Ship Painters and Decorators at a public meeting unanimously carried a resolution strongly protesting against the threatened action of the tramways committee in handing over the absolute control of the tramways department to the electrical engineer as "being utterly undemocratic and a violation of the elective principle."

THE Wolverhampton Town Council have accepted the following tenders in connection with the extensions at the electricity station:—Messrs. Babcock & Wilcox, Ltd., London, amounting to 5,622/., for the supply of boilers, an economiser and feed pumps; Mr. John Thompson, Ettingshall, amounting to 765/., for the supply of a steel chimney and feed-water tank; Messrs. Willans & Robinson, Rugby, amounting to 1,214/., for the supply of alternators and condensing plant; Messrs. H. Gough & Son, Wolverhampton, amounting to 2,900/., for the execution of works at the station.

THE Institute of Sanitary Engineers held a meeting in Birmingham for the purpose of discussing the desirability of forming a Birmingham centre of the Institute of Sanitary Engineers. It was decided to form a Birmingham centre,

KAHN SYSTEM REINFORCED CONCRETE

➤ THE KAHN TRUSSED BAR IS A SCIENTIFIC & ECONOMICAL REINFORCEMENT.

➤ MARK THE FIXED SHEAR MEMBERS. THEY MEAN—TO THE CONTRACTOR, RAPIDITY AND ECONOMY OF ERECTION—TO THE OWNER THEY MEAN EFFICIENCY AS WELL.

➤ NO LOOSE MEMBERS TO FIX. WE CHARGE NO ROYALTIES. WE SELL TO ALL CONTRACTORS.

➤ WE WANT YOUR ENQUIRIES FOR FOUNDATION RAFTS, FOOTINGS, BEAMS, FLOORS, LANDINGS, STAIRCASES, ROOFS, &c.

THE UIHLEIN BUILDING.—KIRCHOFF & ROSE, ARCHITECTS.

Walls, Columns, Floors, Roof, &c., entirely constructed on the Skeleton Frame Type, in the Kahn System of Reinforced Concrete.

TRUSSED CONCRETE STEEL CO.,
CAXTON HOUSE, WESTMINSTER.

which it is proposed should include the counties of Warwick, Worcester, Stafford and Shropshire. Dr. R. A. Lyster, medical officer of health for Handsworth, was unanimously elected first president of the centre, and it was decided to appoint a working committee to arrange for an inaugural meeting to be held shortly. Sessional meetings will be held during the winter months, and visits to places of interest to sanitary engineers will be arranged during the summer months. Mr. E. J. Harber, of Acock's Green, was elected local hon. secretary.

On Saturday extensive additions to the waterworks belonging to the Falkirk and Larbert Water Trust were formally inaugurated. The extensions have occupied about six years to complete, and have cost in round figures about 135,000*l.*, making a total capital expenditure on the scheme of 235,000*l.* The engineer was Sir W. R. Copland, Glasgow, and the following were the contractors:—New filters—Messrs. A. Stark & Son, Kilsyth and Glasgow; Drumbowie reservoir (storage 120,000 gallons) and pipe track to Faughlin (six miles of 19-inch pipe), Mr. John Best, Edinburgh; catch-water drain (three miles in length) and new compensation reservoir at Earl's Burn (100,000,000 gallons), Messrs. Marshall, Sweeney & Co., Falkirk. Mr. C. Massie, superintendent to the Water Trust, has had the general supervision of the scheme.

At a meeting of the Malvern Hills Conservators it was stated that the Ecclesiastical Commissioners had no intention of sanctioning the opening of a quarry on the western side of the hills north of the Wyche Cutting. This intimation had been received in reply to a letter from the conservators pointing out that the quarries had already effected a great change in the hills, and that their disfigurement was a serious matter to Malvern. A committee of the Malvern Urban Council having recommended that certain land belonging to that authority should be sold, it was resolved—although the committee's recommendation has been rejected—that the Council should be asked to formally dedicate land surrounding the Camp Hill reservoir and the Welland Hills land to the public, to prevent future proposals to sell.

A COMMITTEE of the House of Lords, after an inquiry lasting several days, have sanctioned a scheme proposed by the Corporation of Birkenhead for obtaining a supply of water from the rivers Alwen and Brenig, which are in the

watershed of the Dee, in Denbighshire. The town at present obtains its supply from wells in the red sandstone of the Wirral peninsula, but this supply is diminishing in quantity, and, owing to the increased depth of the pumping, deteriorating in quality through the infiltration of sea water. The new scheme is to dam up the rivers already named and carry the water by an aqueduct forty-one and a half miles long across the Dee, at Connah's Quay, to Birkenhead. It is proposed, in the first instance, to construct only the Alwen reservoir, from which, after providing compensation water, the promoters will get a supply of seven million gallons a day. This service alone is expected to supply the needs of the borough for thirty-four years. The Bill took power to supply water by agreement within a radius of twenty miles from the pipe-line.

A CONFERENCE of representatives of authorities concerned in the purification of the Thames estuary, convened by the Port Sanitary Authority of the City Corporation, was held at the Guildhall on Tuesday, for the purpose of considering the existing situation, and with a view to taking such action as might be deemed necessary in the interest of the public health. The following resolution was adopted:—That, in the opinion of this conference, the present system of discharging sewage into the Thames estuary and elsewhere is dangerous to the public health, and detrimental to an important food supply; that legislation should be initiated by the Local Government Board at as early a date as possible to efficiently deal with the matter; and that, in the meantime, the Corporation and other authorities possessing statutory powers should continue to urge upon the various bodies concerned the desirability of adopting some system of sewage purification.

SECONDARY SCHOOLS IN SUSSEX.

THE education committee to the County Council for West Sussex, after careful consideration and in response to the urgent requirements of the Board of Education, have decided to ask the County Council to consent to the erection of two secondary schools for girls at Chichester and Worthing. The Board of Education refuse to recognise any longer the existing pupil-teachers' centres at Chichester

WE SOLICIT YOUR ENQUIRIES.

LONDON 118 QUEEN VICTORIA ST. E. C.

d Worthing, and have warned the committee that they can only recognise the pupil-teacher centre at Horsham for a short time longer. They therefore require steps to be taken to provide secondary schools for girls which the candidates and pupil teachers should be required to attend. Through the assistance of several members of the County Council the offer of sites has been secured both in Chichester and Worthing. These sites are particularly suitable for the purpose and can be acquired at reasonable cost. The probable cost of each school will be as follows:—

Chichester.—Cost of site (8 acres in Stockbridge Road), 50*l.*; erection of school for 200 girls at 45*l.* per head, 9,000*l.*; laying-out playing fields, asphalt, boundaries, &c., 1,000*l.*; total cost, 11,750*l.* Annual charge to repay principal and interest on 11,750*l.*, if borrowed for thirty years as at present allowed, will be 646*l.*; or if borrowed for sixty years as proposed in Government Education Administration Bill, February 28, 1907, 470*l.* Charge for maintenance:—Estimated total cost for maintenance, 14*l.* per scholar; fees per scholar, 10*l.*; grant from Board of Education per scholar, 2*l.*; therefore the total net cost per scholar for maintenance will be 2*l.*; number of fee-paying pupils in addition to candidates and pupil teachers, 150. Total net cost of maintenance, 150 × 2 = 300*l.*; total estimated annual charge for building and maintenance, if borrowed for thirty years, 946*l.*; or if borrowed for sixty years, 770*l.*

Worthing.—Cost of site (8½ acres in South Farm Road), 888*l.*; erection of school for 200 girls at 45*l.* per head, 9,000*l.*; laying-out playing fields, asphalt, boundaries, &c., 1,000*l.*; total cost, 12,888*l.* Annual charge to repay principal and interest on 12,888*l.*, if borrowed for thirty years as at present allowed, will be 708*l.*; or if borrowed for sixty years as proposed in Government Education Administration Bill, February 28, 1907, 515*l.* Charge for maintenance:—Estimated total cost for maintenance, 14*l.* per scholar; fees per scholar, 10*l.*; grant from Board of Education per scholar, 2*l.*; therefore total net cost per scholar for maintenance, 2*l.*; number of fee-paying pupils in addition to candidates and pupil teachers, 150. Total net cost of maintenance 150 × 2 = 300*l.*; total estimated annual charge for building and maintenance, if borrowed for thirty years, 1,008*l.*; or if borrowed for sixty years, 815*l.*

The Board of Education also require the committee to erect a girls' secondary school at Horsham to take the place of the present pupil-teachers' centre. It is probable that the school will be required to be erected in 1909 or 1910, and the probable cost both for building and maintenance will be almost exactly the same as the Chichester school.

The proposed sites at Chichester and Worthing have been approved by the Board of Education with a view to the present erection of girls' schools thereon and the future erection of boys' schools.

The committee estimate that a boys' school may be required to be erected in four or five years' time on each site at the following cost:—Cost of erection, 9,000*l.*; cost of laying-out playing fields, &c., 1,000*l.*—total, 10,000*l.*; total cost of maintenance, 400*l.*; annual charge for building and maintenance if borrowed for sixty years, 800*l.* The cost of site is included in the first charge for girls' school.

ARCHITECTURAL CRAFTSMEN.

The annual report of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society states that during the session ten new members have been admitted to the Society, the membership now being 132. This Society has always been fortunate in its presidents, and never more so than in the case of Mr. Herbertson. The manner in which he has performed the high and onerous duties pertaining to the chair must have manifested itself to the members generally, and more particularly to those who had the pleasure of working along with him. Under his able guidance the past session has been one of the most successful in the annals of the Society. Ten ordinary meetings were held during the session, seven papers being read by members of the Society, including President's opening address "Describing of Artificers' Work," address by James Miller, A.R.S.A., "The Byzantine Churches of Constantinople," "Ideal Specification," "Modern Buildings with Steel Construction," "The Philosophy of Art," "Instinctive Art in a City," "Foundations," "Drainage and the Septic Tank," "Building Stones of Scotland." The following visits were made during the session:—The works of

the Cleghorn Terra-Cotta Company, Cleghorn, and Greenock combination hospital. The meetings of the Society have been held in Room No. 302 of the Technical College Buildings, Montrose Street, for the use of which they are indebted to the Governors of the College and to Professor Gourlay.

PLANNING OF SUBURBS.

A MEETING of the Council of the Association of Municipal Corporations was held last week at the Westminster Palace Hotel. Representatives from Birmingham, Bristol, Bournemouth, Brighton, Harrogate, Leicester, Leeds, Liverpool, Manchester, Nottingham, Plymouth, Newcastle-on-Tyne, Sheffield, Wolverhampton and Woolwich attended. They reported that they had considered the powers that would be required in order to place local authorities in the position to control the planning of their suburbs, and also the kind of legislation that would be required to enable that to be done. The committee, having had before them a memorandum of suggested lines for town planning powers prepared by Councillor Nettlefold, of Birmingham, passed the following resolutions, which they submitted for the approval of the Council:—"That power should be given to local authorities to prescribe and regulate the planning of their areas in regard to the laying out of streets in connection with building schemes or otherwise. That the local authorities should have power to appoint committees to deal with the subject and be enabled to delegate their duties to such committees and to co-opt upon such committees persons who are not members of the local authorities. That local authorities should be empowered to combine for the purpose of carrying out the principles laid down by the first resolution." Steps were taken to ascertain from the various local authorities of the country the amount that had been spent on street improvements and open spaces during the past ten years, and the regulations relating to streets and buildings in the various towns. The replies showed that the total amount spent in street improvements and the provision of open spaces, after the land had gone up to building value, by those towns making a return was 12,147,336*l*. To that must be added at least 6,073,668*l*.

for those towns, including London, from which no return had been received. Of that expenditure of 18,221,004*l*. it was estimated that about three-quarters were due to the undoing of evils that were perpetrated more than thirty years ago. Therefore 13,665,753*l*. might have been saved to the ratepayers of England if local authorities had been able during the last thirty years to exercise foresight in the development of their districts. It was not unreasonable to anticipate that at least that sum would be saved to the ratepayers during the next thirty years if town planning powers were granted by Parliament and wisely administered by local authorities. The committee also submitted a draft scheme for a town planning Bill, which they recommended should be approved, and that the President of the Local Government Board should be requested to introduce into Parliament a Bill enabling local authorities to prevent overcrowding in new districts and put an end to the present haphazard piecemeal development of urban districts, which was disastrous to public health and ruinous to the public purse. The Council approved the report and recommendations, but decided to hold another meeting for the discussion of the details of the draft scheme for a town planning Bill. Then a deputation will be appointed to interview the Prime Minister on the subject.

WORKMEN'S COMPENSATION ACT.

THE Council of the Royal Institute of British Architects have submitted questions regarding the Workmen's Compensation Act on various points in which architects are likely to be affected to Mr. Alfred Henry Ruegg, K.C. Their learned counsel has given the following opinion:—

Opinion.

The following questions have been submitted to me under the Workmen's Compensation Act, 1906:—

"1. Under the Act will the client or building owner be responsible or actionable for accident or damage that may happen to the clerk of works (a) if paid directly by him, (b) if paid by the architect, the latter being in this case virtually the agent for the client?"

I am of opinion that the client or building owner will be

able or actionable for accident or damage that may to the clerk of the works, whether he be paid directly client or building owner, or by the architect as for the client or building owner. If employed and ectly by the building owner no question can arise. clearly the servant of the building owner.

aid by the architect—as I understand he is generally by the architect and conforms to his orders—care e taken to make it quite clear that the architect is e agent of the building owner.

his end I should advise that a small printed form be drawn up and adopted by the architects of the e to the effect that they engage "A. B." as clerk of ks on the buildings as agent for and on behalf (D," the building owner. The form should also con- clause that "A. B." agrees to serve the building for the consideration set forth, and to obey the and directions given by the architect on behalf of the g owner.

nderstand that in all cases the money comes from the g owner, and is never paid by the architect out of his ssion.

Is the architect liable for damage or accident that ppen to his assistant when employed either in his r superintending works of buildings in progress?"

n of opinion that the architect is liable for damage dent that may happen to his assistant either when yed in his office or when superintending works of gs in progress.

e assistant, whether himself an architect or not, is, I tand, a permanent servant of the architect, employed id by him and under his sole control.

each of the above cases it is necessary that the acci- ould arise out of and in the course of the employ- and that it should not (except where the injury results th or serious and permanent disablement) be attri- e to the serious and wilful misconduct of the injured himself. (Section 1.)

s also necessary (except where the employment can scribed as manual labour) that the remuneration ot exceed 250*l.* a year. (Section 13.)

What is the position occupied by architects under orkmen's Compensation Act, 1906, with respect to

their pupils, articulated to them by indenture in the form used by the Royal Institute of British Architects?"

I am of opinion that a pupil so articulated is a workman within the meaning of the Act, and that the architect to whom he is bound is his employer, and consequently liable as hereafter stated to pay compensation to the pupil or his dependants in case of injury or death arising from accident happening in the course of his employment and arising out of his employment.

The relation of master and servant, or employer and workman, arises out of a contract of service. Apart from the express covenant in the articles of pupillage, a contract of apprenticeship is a contract of service, and of itself establishes the relation of master and servant.

An apprentice receiving no salary is in my opinion not entitled to weekly compensation under the first schedule (1) (b) of the Act, for the compensation is based upon the "earnings," and cannot exceed 50 per cent. of such earnings. In case of death also, when no salary has been paid, I think no compensation becomes payable, for the claim of dependants must be founded upon dependency, either total or partial, on the deceased workman's "earnings" at the time of the death—schedule 1 (1) (a). Where a small salary is paid by the architect, I think the pupil would be entitled to receive as weekly compensation a sum not exceeding 50 per cent. of whatever such salary, when computed into weekly payments, amounts to.

If the injury results in death, and the pupil who is receiving a salary leaves dependants wholly dependent on his earnings at the time of death, the dependants would become entitled to a sum equal to the earnings of the pupil for the three years preceding the death, if he has been so long employed, with a minimum of 150*l.* If the pupil had not been employed for three years, then the sum would be 156 times his average weekly earnings during the period of his actual employment as a wage-earning workman.

In case of death, where the dependants are not wholly dependent, such a sum, not exceeding the above amounts, as an arbitrator might think reasonable.

I must point out that if the pupil is under twenty-one years of age at the date of the injury, and his average earnings are less than 20*s.* a week, he may be awarded 100 per cent., instead of 50 per cent. of such earnings, in case of

incapacity, but not in any case exceeding 10s. a week—Schedule 1 (1) (b) (c)—and where, in such a case, the amount of compensation is reviewed after twelve months, the compensation may be increased to 50 per cent. of the weekly earnings which the workman would probably have been earning at the time of the review, if he had not been injured—Schedule 1 (16).

"4. What is the liability (if any) of the building owner towards the architect employed by him?"

I am of opinion that (except in the unusual case of an architect in the permanent employment of a person, or public body, who has contracted to serve such person or public body and to perform his duties under their control, and who receives less than 250*l.* a year), the architect is not a servant or workman of the building owner, and such building owner incurs no liability to him under the Workmen's Compensation Act, 1906. The architect who undertakes to superintend building operations for a commission does not enter the service of the building owner, or contract to serve him. He is in law a contractor, and, so long as he carries out the terms of his contract, is quite independent of any control on the part of any building owner.

NEW COUNTY HALL FOR LONDON.

A REPORT has been prepared by the establishment committee of the lately elected London County Council concerning the proposed county hall. It begins as follows:—

We have given anxious consideration to and have most carefully reviewed the present position of the scheme for the provision of a new county hall, and, for the information of those members of the Council who have not had the opportunity of fully considering this very important subject, we have thought it desirable to present a comprehensive report containing not only a statement of the principal considerations which led the Council to take the necessary steps to acquire the site at Belvedere Road, but also a statement of the present position of the scheme.

The committee narrate the history of the project since 1889. After investigation it was decided to apply to Parliament in 1906 for power to acquire the Belvedere Road site, which was found to be less costly than others.

The site is conveniently near the Houses of Parliament and the Government offices, and although on the south of the river is conspicuous from many of the streets on the opposite side of the river. It is also in a central position with regard to means of communication from all parts of London, being near Waterloo Railway Station, and reached from the City in a few minutes, and a tube railway links Waterloo with Charing Cross, Piccadilly, Oxford Circus, the Baker Street and Great Central termini, and eventually Paddington Station. Westminster Bridge Station on the District and Metropolitan Railways is within a few minutes' walk, and the district is served by numerous routes of omnibuses and by the Council's tramways, which link the site with South London and the City by way of Victoria Embankment. It will be seen that there are numerous means of communication between the neighbourhood of the proposed site and the termini in London of all the great railway lines.

The architect has stated that as the river at this point runs nearly due north, and the site being approximately parallel with the river, three façades might be respectively on the south, east and west aspects, and the maximum sunlight might thus be secured throughout the building. The scheme of development contemplates forming a public embankment next the river, similar to that in front of Thomas's Hospital, which includes a terrace apart from the public embankment, and which would add architectural dignity to the river frontage. To improve the vehicular approach, and also the lighting of the lower floors of the east frontage, the building line would be 50 feet from the buildings on the east side of Belvedere Road.

The committee felt that the opportunities of combining the provision of adequate office accommodation to meet present and future needs of the Council with the carrying out of a great improvement at a moderate cost to the ratepayers was unique, and they were convinced that the Council, if it adopted the proposals, would secure a result worthy of the central municipal authority of London, and one which would be a prominent factor in insuring the efficient and expeditious performance of the ever-increasing duties of the Council.

In accordance with the resolution of the Council, a Bill was made to Parliament in the London County Council Bill.

Bill in the session of 1906 for authority to acquire any interests in the site which might be purchased by agreement. The second reading of the Bill was agreed to without a division in the House of Commons, and was afterwards unanimously approved by a committee of that body presided over by Mr. Billson. The Bill subsequently came before the House of Lords, where it was read a second time, and was then considered by a committee presided over by the Earl of Camperdown. The Bill duly received the Royal assent on July 20,

The Council has approved the conditions of a competition for designs for the new county hall. The particulars were advertised on February 7, 1907, and designs for the preliminary stage of the competition must be sent in on August 27, 1907. The authors of the designs in the preliminary stage and eight architects, who were specially invited by the Council, will compete in the final stage of the competition. The result of the competition will be submitted to the Council early in 1908.

The conditions provide that the greatest importance is to be attached to simple and convenient planning, and that buildings may, at the discretion of the Council, be erected in successive blocks, but that no special liabilities shall be incurred by the Council for the payment of the cost of the building through this course.

It is understood that the coffer dam will take approximately six months to construct, and that it is anticipated that work can be commenced in June 1908. By January 1910 the site will be rendered less liable to flooding, and the excavating for and constructing the concrete raft foundation wall could proceed. It is anticipated that the work will be completed in approximately twelve months, i.e. January 1910, the superstructure commenced, and the whole building completed in six years, i.e. by 1916.

As the design has been selected, it is hoped that arrangements can be made whereby parts of the building can be completed and occupied, and by this means enable the Council to give up by degrees the existing office accommodation. At the present time it is impossible to fix a definite date by which the building will be ready for occupation, but efforts will be made to have some part of the building ready about Midsummer 1913.

Special precautions will have to be taken near the abutment of Westminster bridge owing to the high level at which the foundations of the abutment are placed, and such arrangements can only be settled after a full investigation has been made of the piling around the abutment.

We have considered the possibility of utilising some part of the Council's surplus lands, but in several instances, apart from the question of size, the high value of the land makes the sites quite prohibitive for the erection of a new county hall. Indeed, there is only one site, viz. the Westminster improvement area, which appeared to us a possible one for the Council's purposes. The cost per acre of this site is 50 per cent. higher than the Belvedere Road site, and having regard to the large amount of money already expended in acquiring the properties in the latter site and the compensation paid for matters for which the Council would obtain nothing if offered in the market, the adoption of an alternative site at this stage would, we are advised, involve a loss of considerable magnitude. In view of these circumstances we cannot advise the Council to adopt any other site.

Having carefully reviewed the present position of the scheme for the provision of a new county hall, and having regard to the stage which has been reached in the acquisition of the site and to the large sum of money which would be lost if the Council did not proceed, and also to the fact that the competition approved by the Council has been in progress for ten weeks, we have come to the conclusion that the best course for the Council to take is to go on with the scheme with all possible despatch, in order that the staff may be housed in the new building at the earliest moment. The sum to which we allude as that which would be lost to the Council represents the amounts paid in compensation for trade disturbance, costs of removal, special machinery, plant and fixtures, &c., the customary allowance for compulsory purchase and the special value to owners. If the course we contemplate be adopted it will tend to reduce to a minimum the dead weight of the interest on the money already expended on capital account, and will enable the Council to give up, as soon as possible, the present scattered offices. In order to proceed on these lines it is necessary at this stage that the trial borings should be made forthwith.

Are you interested in WOOD PRESERVATION?

ANTHROL protects all varieties of wood from decay, whether in any situation be damp or dry, and from the ravages of all wood-destroying insects, including the white ant on shore and the teredo in sea water. Rats will not touch wood which has been treated with **ANTHROL**.

Full particulars and prices will be sent on application.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

ANTHROL COMPANY, Kinning Park, GLASGOW;
and 6 Crosby Square, LONDON.

VACANT LAND, HOLBORN TO STRAND.

THE improvements committee of the London County Council have prepared a report respecting the surplus land on the Holborn to Strand route. The improvement cost about 5,136,200*l.*; the value of the surplus land exceeds 4,000,000*l.* The total frontage was 5,585 feet, and the Council have disposed of only 1,564 feet, leaving for disposal about 4,000 feet, or about 70 per cent. of the whole. The rents amount to 22,800*l.*, while the interest during the current financial year is about 126,580*l.* Next year there will be a further charge to be met as sinking fund of about 25,400*l.*, making a total of 151,980*l.*

The two chief reasons alleged by those who criticise the Council for the delay in disposing of the land are the high prices put upon the land and the severity of the Council's building conditions. Some of the leading firms of surveyors hold that the sites in the Strand and Aldwych are at present too highly priced; other firms maintain that the prices asked are not higher than those which the Council should ultimately obtain. Having regard to the fact that the valuer, with his great experience, strongly advises that the sites are not overvalued, the committee do not recommend the Council to accept lower prices for the land than those which have hitherto been asked.

While it does not appear that in essentials the building conditions differ from or are more onerous than those which are customary on other large estates in London, there seems to be a very general feeling that in their details they are somewhat exacting, that the Council is inclined to insist too strictly on their fulfilment, and that the conditions are inelastic. The committee have accordingly modified, shortened and simplified the conditions to the greatest extent that they have thought it possible to do without prejudicing the interests of the Council. They propose in the arbitration clause to provide, as hitherto, that disputes arising between the Council and its lessee before plans and specifications have been approved shall be decided by the Council's architect; but that disputes arising after such approval shall be decided by an arbitrator to be agreed upon between the parties, or, if they cannot agree, to be nominated by some person to be named in the building

agreement at the time when it is executed. This has the advantage of giving the intending lessee an opportunity of agreeing upon an arbitrator or of suggesting who the arbitrator shall be or who shall nominate the arbitrator. The Council on May 26, 1903, decided that the clause to be inserted in the conditions with regard to land fronting the Strand, Aldwych and Kingsway should provide that the elevation of the buildings on the land should be of marble, granite, Portland or other approved stone or brick, and should be of such design as the Council approved as worthy of the position. The conditions, as amended, provide that a lessee shall erect a building of an elevation and of materials approved by the Council, and the condition mentioned above is therefore no longer needed in a separate form.

It is considered that the difficulties of the case will be adequately met merely by modifications of the building conditions. It must be remembered that the area dealt with is a large one, and that the thoroughfares are not at present the commercial or business connection which they will have when more fully developed. This may have a deterring effect on investors unless counterbalancing inducements are offered them. It is therefore suggested that until a certain number of the sites have been let, the commercial character of the thoroughfares should be established, lessees should be allowed to pay for the first year a peppercorn rent, for the second 25 per cent. of the ultimate rental, for the third 50 per cent. and for the fourth 75 per cent. of the ultimate rental. It would thus be five years before the Council came into the enjoyment of the full rental of the sites, but it would sacrifice nothing of the ultimate value of the land. This course will greatly promote the initiation of building operations, which is a matter of supreme importance to the Council. The Council has already in principle adopted this method. In the proposal for letting to the Victoria Embankment Contract Syndicate agreed to on October 31, 1905, but not proceeded with, the syndicate, two years' peppercorn was allowed, with increasing rent for the next three years, the full rent coming into charge until the sixth year. In the proposal for letting to a syndicate agreed to on March 20, 1906, for the central portion of the site between Aldwych and Strand, one year's peppercorn was allowed with a rent

the next two years. This letting also was not pro-
 with by the syndicate. It is doubtful whether the best results can be obtained
 in this concession of a graduated rent unless the
 can succeed in interesting and gaining the active
 ation of the leading surveyors in the disposal of its
 On July 24, 1906, the Council conceded the principle
 of commission, but on a scale so far below the one
 in the profession that, as an inducement to
 of standing, it appears to be practically useless.
 ding firms consider that the present scale would not
 them for actively co-operating with the Council, but
 e remuneration should be fixed on a scale more
 approaching, though in the case of the larger sites
 considerably short, of the customary professional
 As these firms have a large number of clients, and
 have opportunities of introducing investors, it is
 that their assistance would be of great value to the
 . The usual commission in respect of property in the
 parts of London is half a year's ground-rent, but in the
 suburban property one year's ground-rent is gener-
 cowed. The Council's present scale varies from one-
 of a year's rent in the case of a letting at 500*l.* a year
 tenth of a year's rent in lettings of from 2,000*l.* to
 a year. The Auctioneers' Institute of the United
 m have suggested that an equitable scale would be
 ws:—On lettings up to 500*l.* a year, half a year's
 on lettings up to 5,000*l.* a year, half a year's rent on
 and one-fourth on the balance; on lettings up to 10,000*l.*
 the last-mentioned scale up to 5,000*l.* and one-eighth
 ar's rent on the balance.
 etting property it is the general experience that it is
 to place the matter in the hands of one firm. The
 ttee think the Council would be wise if it appointed
 m to act as its agents in addition to the valuer,
 of as at present offering the land to the whole of
 fession. This agent would have full particulars of
 operty and would receive commission on the Insti-
 scale on any business which resulted from his intro-
 . The valuer's position would not be altered, and
 ould still represent the Council. The agent would
 ith the valuer, who would, of course, still negotiate
 y with intending lessees who made inquiries through

his office. The agent would share his commission with
 firms who introduced customers, and by a scheme of this
 sort the whole profession would become interested in the
 Council's surplus lands. It is therefore recommended—

(a) That the building conditions set out in the state-
 ment separately submitted by the improvements committee
 on May 14, 1907, relating to the Council's surplus land, be
 approved as a general form.

(b) That, until further order, leases of the land now
 unlet on the area of the Holborn to Strand improvement be
 granted on the basis that the rent for the first year be a
 peppercorn, for the second year one-fourth, for the third
 year one-half and for the fourth year three-fourths of the
 rent to be paid in the fifth and succeeding years.

(c) That the appointment, for one year, of a firm as
 agent, in addition to the Council's valuer, to deal with the
 disposal of the surplus land from the Holborn to Strand
 improvement, be approved; that such agent be paid com-
 mission only in respect of lands let on his introduction, the
 commission being on the scale suggested by the Auctioneers'
 Institute of the United Kingdom, and set out in the fore-
 going report; and that it be referred to the improvements
 committee to submit for the Council's approval the name of
 a firm for the appointment.

(d) That the resolution of May 26, 1903, with regard to
 the elevation and materials of buildings to be erected
 on land fronting the Strand, Aldwych or Kingsway, be
 rescinded.

(e) That the resolution of July 24, 1906, with regard to
 the payment of commission in connection with the letting of
 surplus land from the Holborn to Strand improvement,
 be rescinded.

ELECTRICITY IN ROLLING-MILLS.

AMONG the papers read at the Iron and Steel Institute was
 one by Mr. D. Selby Bigge, of Newcastle-on-Tyne, on the
 application of electricity to reversing rolling-mills of high
 power as carried out at the Hildesgarde Works, near Teschen,
 in Austrian Silesia. The advantages to be derived were as
 follows:—

DU RESCO

THE KING OF WATER PAINTS.

FIRST in the Field. The FOREMOST ever since.

THE SILICATE PAINT CO.

Made and sold a Water Paint in 1875.

Years' Experience has stamped

DU RESCO

as being the premier Water Paint.

MANUFACTURERS—

THE SILICATE PAINT CO.,

J. B. ORR & CO., Ltd.,
 CHARLTON, LONDON, S.E.

1. For rolling-mills in Class I., *i.e.* with blast-furnaces attached. The possibility, now that the electric reversing-mill problem has been solved, of entirely dispensing with all coal-fired boilers and their attendant charges for firemen, conveyance of coal, removal of ashes, repairs and insurance costs, &c., the electric power for operating the complete rolling-mill plant and auxiliaries being primarily derived from the waste gases of the blast-furnaces.

2. For rolling-mills under Class II. with no blast-furnaces attached. The entire removal of boiler plant as above in the case of a cheap outside power supply, or the great reduction in the number of boilers required for working the mills, and the generation of the power in any convenient spot within reasonable distance of the works, with high-tension mains to the rolling-mill balancer converters.

3. Increased output, the rolling-mill motors being made to run at any desired speed direct coupled to the rolls. The speed of rolling being controlled only by considerations such as the rapid handling of the material and the mechanical strength of rolls and housings.

4. Extreme simplicity of the direct-coupled electric reversing-mill, the whole operations of rolling, reversing and speed regulation being controlled by one lever.

5. Decreased cost of upkeep, as owing to the use of electric motors with their continuous rotary action and regular torque, the breakages of coupling boxes, standards, pinions and necks are reduced to a minimum.

6. Absolute control over rolling-mill costs and power absorbed at any stage of all rolling operations by the use of electric recording and automatic instruments, such exact control having been impossible in the case of steam.

7. Gain in space formerly occupied by ranges of boilers, coal bunkers, railway sidings, &c., which in some overcrowded works, or where land is of high value, is an item of considerable importance.

8. The great reduction in power used in connection with reversing rolling-mills, owing to the method of utilising a balancing converter upon the Ilgner principle, the energy absorbed by the converter, which is derived direct from the central generating station or mains, being about one-tenth of the maximum value or torque upon the mill, even when the load fluctuates on the mill between 0 and 10,000 horse-power.

9. In the event of new mills being laid down, the with which the rolling-mill motors can be applied direct to the rolls without the necessity of large and costly foundations, as is the case at present with heavy reciprocal steam rolling-mill engines.

10. The very large reduction, in the majority of cases, the power cost per ton of steel rolled, owing to the foregoing considerations. Less than twenty kilowatt-hours are per ton of blooms rolled, which, in the case of mills with blast-furnaces adjacent, or waste gases available, and producing electricity at 0.25*d.* per unit, works out at under a ton.

In order to make himself familiar with the varying conditions which obtain at different works, Bigge has, during the past few months, visited a number of the principal steelworks in this country as well as on the Continent. In many cases the reduction of working costs, which can be effected are enormous, would in themselves represent a dividend by no means negligible upon the total capital of the firms in question. Steelmakers in this country are to maintain their position when prevailing prices are at a low rate, they cannot afford to let matters of such moment pass unnoticed, and the author would urge upon them the most minute consideration to this most important subject. The first reversing rolling-mill just described has only been in operation about nine months, and already the continental steelwork owners and engineers have lost no time in availing themselves of this new innovation. Two electric reversing rolling-mills of 10,000 horse-power each have been started up at the Resicza Ironworks in Hungary, while another electric reversing mill of 15,000 horse-power is being erected at the Rombacher Ironworks, near Metz, and another is to be installed at the Hüstener works, Hülse. It will therefore be apparent, from the rapidity with which the matter has been taken up on the Continent, what great importance is attached to the subject. Indeed, in the author's opinion, the day of the electric rolling-mill has come, and it has come to stay. The preliminary electric rolling-mill equipments to which he has alluded are but the first stepping-stones to a complete revolution in the method of rolling iron and steel.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL

ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ALSTON.—May 31.—The Cumberland education committee invite architects to submit sketch plans, with outline specification and estimate, for a dual secondary school at Alston, Cumberland, for about fifty boys and girls. The plans, which must be in accordance with the regulations of the Board of Education, will be received not later than May 31 inst. by Mr. C. Courtenay Hodgson, secretary, the Courts, Carlisle.

HESWALL.—The Hoyle and West Kirby administrative sub-committee for education invite competitive designs for a new elementary school to be erected at Heswall, to provide accommodation for 300 children. Conditions and instructions may be obtained upon written application to Mr. John H. Grundy, clerk to the administrative sub-committee, District Council Offices, Hoylelake.

IRELAND.—July 2.—The Kilkenny Corporation invite competitive designs for a Carnegie free library, to cost not more than 1,800l. All particulars from Mr. E. O'Connell, town clerk, City Hall, Kilkenny.

IRELAND.—July 1.—The Kingstown Urban District Council invite competitive drawings for houses for the very poor. The first premium will be 100l. and the second 20l. The selected plans to become the sole property of the Council, and no further remuneration shall be paid to the architect should the Council decide to carry out the works themselves. Particulars may be obtained on a deposit of 1s. with Mr. M. A. Manning, town clerk, Kingstown, Ireland.

WEYMOUTH.—July 30.—The Weymouth Town Council invite designs for a pavilion to be erected on the north side of the pier. One hundred guineas will be awarded for the selected design, such design to become the property of the Council. Mr. H. A. Huxtable, town clerk, Municipal Offices, Weymouth.

WALES.—May 27.—For erection of a school at Briton Ferry, for the Glamorgan County Council. The Glamorgan County Offices, Westgate Street, Cardiff.

WALES.—May 29.—For the erection of a police station at Cwm, Mon. Deposit 1*l.* 1*s.* Mr. William Tanner, F.S.I., county surveyor, Newport.

WALES.—May 31.—For the erection of an addition to the infirmary at the workhouse, Merthyr Tydfil. Mr. Thomas Roderick, architect, Clifton Street, Aberdare.

WALES.—May 31.—For the erection of a lock-up at Hakin and a petty sessions room at Milford Haven, Pembroke-shire. Mr. Arthur H. Thomas, assistant county surveyor, St. Thomas Green, Haverfordwest.

WALTHAM HOLY CROSS.—May 31.—For taking-down and rebuilding the bridge over the Cobbin Brook in the parish of Waltham Holy Cross, Essex. Mr. Percy J. Sheldon, chief surveyor, Chelmsford.

WILMCOTE.—June 4.—For the erection of station buildings at Wilmcote, Warwickshire. The Engineer to the Great Western Railway, Paddington Station, London.

WOKINGHAM.—May 31.—For the building of a manual instruction and cookery centre at the Westcott Road Council school. Deposit 2*l.* 2*s.* Secretary to the Berkshire Education Committee, The Forbury, Reading.

SHERIFF GUY has issued judgment in an important question under the Workmen's Compensation Act. A labourer, John Burns, of Leith, was mixing a quantity of lime for use in two villas in course of erection in Edinburgh when two boys not connected with the employment, and who were in the public street, threw stones, which landed in the lime. The lime was splashed up into Burns's eyes, as the result of which he has permanently lost the sight of one eye. Burns claimed compensation under the Act, which was resisted by his employers on the ground that the accident did not arise out of his employment. Sheriff Guy has now given judgment in favour of pursuer, holding that the accident arose out of, and in the course of, Burns's employment, awarded him compensation under the statute, and found him entitled to expenses.

THE trustees of Shoreham Harbour have instructed Mr. A. T. Walmisley, M.I.C.E., the engineer, to engage the services of an experienced contractor to execute such protective works as would prove serviceable pending their consideration of a tidal harbour. The width proposed for such tidal passage at the site of the lock is 130 feet, and if carried out as proposed in the engineer's report of May 6, will permit of a temporary tidal passage 50 feet wide being reserved on the south side during the construction of a new lock 45 feet wide on the north side. To form the side walls, sluices and gate sills a temporary dam will be built in the centre of the 130-foot way, enclosed by return ends on the east and west sides, which dam would be cleared away at completion and the space serving as the temporary south channel filled in.

HOUSE AND DAIRY AT PORTISHEAD, SOMERSETSHIRE.

VARIETIES.

A GLASS roof, at a cost of 600*l.* or thereabouts, is to be erected over the engineering yard of Hartley University College, Southampton.

A LARGE number of plans for new houses, &c., were submitted for approval at the last meeting of the Hexham Rural District Council, and the chairman (Mr. Scott) said that it seemed there was quite a revival in the building trade in their district.

THE London County Council have given sanction to the erection of a building at the roof level of Messrs. Waring & Gillow's new premises, Nos. 164-180 Oxford Street, W., to a greater height than that prescribed by the London Building Act, 1894.

THE Croydon Borough Council are fixing washers to leaky taps free of charge. A recent inspection of 2,144 houses revealed the need of new washers in 252 taps, and these were supplied and fixed at once by the Council inspectors, who carry with them all that is required for this work.

A MEETING of the London County Council will be held in the County Hall, Spring Gardens, on June 11, for the purpose of considering and deciding whether the Council shall promote in the next session of Parliament legislation dealing with the prevention of nuisance from smoke in London, and also of considering and deciding out of what fund the cost of promoting such legislation shall be paid.

THE Manchester Board of Guardians have adopted a report of the Crumpsall committee, who submitted plans showing certain extensions proposed to be made to the workhouse buildings for the purpose of increasing the accommodation for inmates at the Crumpsall workhouse, and recommended that they be approved and forwarded to the Local Government Board for their approval, and that the Board be requested to sanction the expenditure of a sum not exceeding 21,000*l.* in carrying out the works. The plans provided for the further accommodation of 410 people.

THE plans of a proposed secondary school for girls at Lancaster have been passed. In order to enable the Lancaster Corporation to obtain the sanction of the Local Government Board to borrow 16,114*l.* for the purchase of land and the erection of the school, the County Council will undertake to guarantee any deficiency in the amount raised by the local penny rate to meet the annual charge for interest on the debt and repayment. The school will accommodate 264 girls. The county architect has also prepared plans for the erection of a new school at Trawden at a cost of 9,298*l.*

MR. J. S. JEANS, the secretary to the British Iron Trade Association, in his annual statistical report to the members, says:—The course of business in the iron trade during the year 1906 has been from many points of view remarkable, and in some respects quite phenomenal. The output of iron and steel in most countries, including Great Britain, reached figures that had not been touched in any previous year. The exports of iron and steel, like the output of those metals, attained an exceptional, if not record, volume. The iron trade of the United Kingdom has exhibited a recuperative force, an elasticity and an adaptability which were hardly deemed possible a few years ago. Our total production of iron and steel in 1906 was probably of the value of fully 160 millions sterling. The exports of iron and iron products as set out in the Board of Trade returns have been of the value of over 90.8 millions sterling. Our corresponding imports of iron and iron products have been over 20.3 millions sterling. The increased value of imports and exports under both heads, and including imported ores, was not less than 20.6 millions sterling.

THE water committee of the Birmingham City Council report that the process of clearing up and the disposal of plant in the Elan valley have proceeded steadily during the winter. The remainder of the plant, railway material, wooden buildings, &c., was disposed of at a sale by auction on May 8, 9 and 10. Arrangements are proceeding for the erection of the permanent buildings required in connection with the administration of the works. The chief of these is the new school to replace the school at Nantgwillt, in pursuance of section 55, subsection 4, of the Birmingham Corporation Water Act, 1892. By arrangement with the local authorities the school is to be built in the Elan village, on the Brecon side of the river, instead of on the Radnorshire side, where the old school was situate. The other buildings to be erected at once are a superintendent's house and offices, post office and shop, ten cottages for workpeople and workshops. The committee have instructed Mr. H. T. Buckland, the architect to the Birmingham education committee, to act as architect for the new school and other buildings.

BUILDING IN SYDNEY.

THE report of Mr. W. L. Vernon, the Government architect, for the year ending June 30, 1906, states that the expenditure for the year in his department amounted to 292,901*l.* os. 7*d.*, while in the preceding year the amount was 194,021*l.* 18*s.* 3*d.*

The most notable works in progress during the year are as follows:—

New Central Railway Station.—A number of contracts—particularly those entered into in the previous year and partially executed—were brought practically to a completion, although at the end of the year the station was not quite ready for opening. A considerable amount of day-labour work was carried out in connection with works partly executed at a previous date, and in connection also with a large number of special fittings required by the Railway Commissioners to enable them to occupy the buildings on a fixed date, and at the same time to bring over the whole of their working business.

Belmore Park has been laid out during the year with lawns, shrubberies and pathways, leaving the still further

embellishment to be dealt with by the City Council—arrangements being made for its rededication as soon as possible.

Royal Prince Alfred Hospital.—The Pathological School (a building presenting the most modern appliances for pathological studies) was brought to a practical completion during the year—a contract having been entered into for its erection.

Penitentiary and Female Prison, Long Bay.—These extensive works were advanced one definite stage during the year, and the two additional wings have been built under contract. The buildings now erected for female prisoners are sufficiently complete to enable the Department of Justice to consider their occupation in a temporary way, and the possible introduction of a modified system of prison labour in connection with the general outdoor work—of which the scheme gives considerable opportunity.

University "Fisher" Library.—The stonework for this building—of Perpendicular Gothic character—progressed somewhat slowly during the first portion of the year, but latterly more money was granted for the purpose and considerable activity took place. It was also pointed out that this costly building requires roofing in as expeditiously as possible, in order to prevent damage. As the heads and tracery of the large reading-room window are now fixed in position, some idea can be formed of the permanent appearance the building will give.

State Library—"Mitchell" Wing.—The Government came to a determination during the year to provide the long-deferred building for the housing of the literary treasures given to the State, conditionally, by Mr. Mitchell. It was decided that the "Mitchell" library should form part of a larger scheme for the housing of the general State library, and the branch was instructed to prepare designs and plans for a suitable building to be erected in Macquarie Street, with a northern front overlooking the Palace gardens, but so placed as to chiefly occupy lands not in the enjoyment of the public. The scheme was placed before the Parliamentary standing committee on Public Works, and although some opposition was shown to the selection of the site, the scheme was accepted and recommended for adoption by Parliament. Subsequently the necessary Act was passed and instructions were issued to prepare plans and

enter into a contract for the "Mitchell" portion. This has been done, including fittings, at a cost of 25,000*l.*

Royal Naval Victualling Stores, Darling Island.—An important contract was entered into for the erection of these stores on a recently constructed wharf at Darling Island. It was understood that the Imperial naval authorities desired to centre in Sydney the war victualling stores for the three naval stations of Australia, China and India; and by mutual agreement between the Imperial and State Governments, the latter undertook to erect the necessary buildings. Designs were prepared, giving a floor space of upwards of 80,000 super feet, and a contract entered into for their erection. Although the site is a suitable one, it was found that at least one-half of it had been reclaimed from the harbour, and the remaining half was of solid rock. Great care, therefore, had to be taken with regard to the foundations, and eventually, with extensive piling on the reclaimed area, this was obtained. The buildings were practically completed within the year, although certain fittings and appliances remained over for execution during the next year.

University Buildings, Martin Place.—During the year the Premier instituted the Department of Intelligence, with the view of advertising the State and its resources in every possible direction. The establishment of this department led eventually to the sale to the Senate of the University of the remaining valuable unbuilt frontage in Martin Place. An agreement was entered into by which the Senate undertook to spend 50,000*l.* in the erection of suitable buildings, the Government becoming tenant of one-half of the building. It was accordingly designed in the office, with special reference to its general surroundings, and contains (on the Government side) two sub-basements and ten upper floors. Upon entering into a contract with a well-known firm of contractors, the supervision of the works generally was handed over to a private firm of architects, who represented the Senate in the previous negotiations, the control of the final voucher still remaining by arrangement with the Government architect. It is anticipated that this building will be ready for occupation in the short period of eighteen months, notwithstanding the fact that it is erected over the old "Tank Stream," necessitating very deep and extensive foundationwork.

ASPINAL'S ENAMEL CO. NEW CROSS, LONDON, S.E.

Hawkesbury Agricultural College, Richmond.—The continued success of this college, and the increasing applications for admission by suitable students, have compelled the Government to take steps to greatly enlarge the buildings, and during the year considerable additions were made, and plans prepared for a practical rebuilding and duplication of the students' quarters.

Plans were also prepared to form a type for country colleges at Bathurst and Glen Innes, but no building operations have yet taken place. At Wagga Wagga, however, considerable additions are already being made.

The branch was busy during the year with not only repairing a number of the town and country school buildings, but also the erection of new and enlargement of old buildings on the newly determined principles. The chief work consisted of the erection of a substantial two-storeyed building at Wickham, and others of considerable magnitude were those at Annandale, Warrawee and Enmore. Reports were furnished dealing with the future girls' high school in the centre of the city; but it is understood that nothing at present has been determined with regard to its removal to a more advantageous neighbourhood.

During the year the Department of Home Affairs of the Commonwealth Government elected to take over all Federal works eastward of a line drawn through Sydney from north to south, including most, if not all, the metropolitan fortifications and military buildings. It was clearly understood that this arrangement was made not from any failure on the part of the State Works Department to render efficient service, but because the Department of Home Affairs, having practically established a Commonwealth Works Department in Sydney, desired to find professional work for its officers. Consequent upon this it was pointed out that the professional percentage charge of the State Works Department—covering all works, great and small—was to some extent affected thereby, but no determination was arrived at to increase the rate to the State at present.

Special activity was experienced during the year in the reconstruction of rifle ranges and the erection of country drill-halls for the Commonwealth Government.

The branch had continuous work in connection with advising the specially-appointed committee in dealing with theatres and places of public entertainment. As in the

previous year, this work has been of an extensive character and, in addition, assistance has been rendered to the committee in connection with the drafting of a new Act, which it is hoped will shortly be passed by Parliament, to give greater and more defined powers with regard to this subject.

In connection with the settlement of the capital site question by the Federal Parliament, elaborate and illustrated reports were prepared by myself and officers in connection with possible sites at Canberra and Mahkoolma—the latter especially—in connection with the State scheme of retarding the waters of the Murrumbidgee and Couradigbee rivers in the natural chasm at Barren Jack, near Yass. These reports, which were the result of continuous personal investigation on the site, were forwarded for the consideration of the Federal Government in Melbourne.

CONTRACTORS' RISKS IN IRELAND.

JUDGMENT was given last week in the King's Bench Division, Dublin, in the case of Homan & Rogers *v.* Hill, which had been argued last sittings. It was an application on behalf of the defendant for an order setting aside the judgment obtained by the plaintiffs for the sum of 279*l.*, and entering it for him. The action was brought by Messrs. Homan & Rogers, engineers and contractors, to recover 428*l.* 7*s.* 9*d.* alleged to be due by the defendant, Mr. Samuel Hill, builder and contractor, of Cork, for work and labour done, and for goods sold and delivered in connection with the erection of the Ballinasloe lunatic asylum. The defendant had lodged 80*l.* in Court as sufficient to satisfy the demand. The action was tried before Mr. Justice Wright, without a jury, on February 2 last, when judgment was given for the plaintiffs for the amount mentioned. The plaintiffs, it appeared, were sub-contractors, and the items in respect of which they claimed payment were described as extras.

Mr. Justice Gibson, delivering the unanimous judgment of the Court, said he thought the defendant never assented to any such contract as was alleged between the parties and never authorised the work for which he was sued, and there

was no evidence that the defendant derived any benefit from the execution of the work. He was of opinion that sub-contractors acted imprudently in doing extras without written instructions, but once the work was done they were entitled to be paid for it. The order which the Court would make was that judgment would be entered for the plaintiffs for 166*l.* with costs, and judgment for the defendant for 110*l.* 7*s.* with costs. The Lord Chief Justice, who concurred, and who was engaged elsewhere, held a very strong opinion of the absolute rectitude and propriety of the defendant's conduct throughout, and the Court did not express any reflection unfriendly to the plaintiffs.

Mr. Justice Kenny, who delivered a separate judgment, also concurred.

Mr. Justice Gibson suggested that the parties should now turn back to back.

Counsel on behalf of the plaintiffs said they declined to do this, and the case must now be tried out.

DRAINAGE OF EASTBOURNE.

A SESSIONAL meeting of the Sanitary Institute was held at Eastbourne on Saturday. The chairman of the Institute Council, Mr. H. D. Searles-Wood, architect, presided.

Mr. A. Ernest Prescott, borough engineer, read a paper on "The main drainage of Eastbourne." He said the provision of good drainage and pure water were two of the most important duties devolving upon local authorities, but more especially did this apply to seaside and other visiting resorts who catered for the health and pleasure of numerous visitors. The good name and reputation of a visiting resort was chiefly in its sanitation, and this desideratum once achieved it must at all costs be retained, and that by the introduction of modern sanitary science. The larger portion of the main drainage of Eastbourne was of comparatively recent date. Before the year 1881 the town was drained by gravitation, but, owing to its rapid development, it was found necessary to supplement the then drainage by extending the main sewers in various parts of the town. Owing to a large area lying at a low level and being subject to flooding, a scheme of pumping was resorted to, and the town was divided into low and high

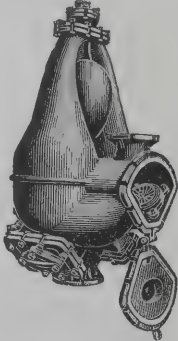

areas. In 1894 the provision for the main drainage of the town was again found to be inadequate, and the late Mr. Henry Law designed a scheme for extending it, for the prevention of flooding, and for making provision for the future growth and development of the borough. The town was now divided into separate areas, viz. a high-level area, with an approximate acreage of 772 acres, and a low-level area of 543 acres. Mr. Prescott concluded with a reference to the late Mr. G. A. Wallis, who designed the first portion of the main drainage, and the late Mr. Law, who was responsible for the extension in 1894, which latter work cost 81,000*l.* His experience gave him some knowledge of the loose and water-logged condition of the ground which had to be dealt with during the construction of the work, and it was sufficient testimony to the engineering skill and ability which his predecessor, Mr. R. M. Gloyne—who supervised the work—brought to bear in the execution of the scheme when he stated that it had done its work efficiently and well, and had thus far stood the test of time.

OLD BUILDING MATERIALS.

In the rebuilding of San Francisco methods of economical levelling and construction have been practised to a greater degree probably than at any other time and place. A typical instance, says the *Engineering Record*, is the work done on the Crocker Building, standing at the corner of Post and Market Streets. This structure, which is ten storeys in height, with a frontage of about 200 feet, escaped any serious damage from the earthquake, but was gutted by fire. The frame of the building being intact, nothing more was necessary than a reconstruction of its interior, and the contractors hit upon the profitable plan of utilising for concrete mixture all bricks, tiling, stonework and flooring which had to be removed. Suitable apparatus was therefore installed, and as fast as the work of tearing down made this material available it went directly to a Gates breaker fed from bins supplied by chutes from various sections of the building. After being crushed to the desired fineness the product of the breaker passed to a mixer, and as the concrete issued from the latter it was taken by a system of elevators and conveyers to all parts of the building where needed. The significant feature of this process lies in the fact that from

At the moment the material was taken from the walls and floors until the time it again became a part of the structure, there was not the slightest break or loss in its handling.

An installation similar to this, but of relatively greater importance because on a larger scale was made by Allis-Chalmers Company at Chicago, when the old Cook County Court-house was dismantled. This temporary crushing plant, purchased by the contractors in charge of the work, A. McMahon & Co., of Chicago, consisted of two breakers, an elevator and a revolving screen, all driven by electric motors. There was a breaker for doing the first crushing and one for handling rejections. The two were set together on the same level and discharged into an elevator measuring 9 feet between centres, which conveyed the material to a dust-jacketed iron frame screen having $1\frac{1}{2}$ -inch perforations. The stone was reduced to $1\frac{1}{4}$ -inch size for concrete, and the dust sold for use with it in place of sand. The over-size material was discharged on a belt conveyer, which carried it back to where it was fed into the smaller breaker. The plant was located in the centre of the building, where it was easy of access for handling the stone as fast as the building was torn down. The crushed product was discharged into bins placed directly under the screen, from which it could be readily loaded into waggons. The contractors found this plant a profitable one, as they were able to sell the crushed rock right in the centre of Chicago; in fact, towards the close they did not remove any of the material from the premises, but disposed of it to the firm putting up new structure.

JAPANESE EXHIBITIONS.

THE Japanese patent-office exhibition building at Dosanbashi, Kojimachi, Tokio, was opened on February 1, 1907. The building is new and covers about 6,120 square feet. The exhibits, numbering over 2,200, are for the most part articles invented or designed by the Japanese, and are protected either by Japanese patent or registration. Among them are clothing, boxes and receptacles, dyed and woven goods, buttons, rings, fans, stationery, toys, agricultural tools and implements, furniture and chemical apparatus, and among the patented articles are found fire extinguishers, engines, pumps, agricultural tools and looms. The exhibi-

tion is a permanent one, and will be open daily. In connection with the international exhibition to be held in Japan in the year 1912, the following revenue is, according to the American Consul-General at Yokohama, reported and estimated:—From the municipality of Tokio, 300,000*l.*; from the national treasury, 500,000*l.*; and revenue from the exhibition, 200,000*l.* The area of the exhibition ground is estimated at about 10,800,000 square feet. The principal buildings to be erected by the Government are two scientific buildings, two industrial buildings, two machinery and electric buildings, transportation buildings, marine product building, zoological, fine arts, agricultural, mining, forestry, foodstuffs, aquarium and horticultural buildings. In addition to the foregoing, three concert halls for the use of the public and a post and telegraph office will be built. Both foreign and domestic exhibits are to be classified, and will be placed in the sections devoted to them. The exhibitors will be allowed to erect buildings for their exhibits within the exhibition ground at their own expense. The site of the exhibition has not yet been selected, but the Finance Department and the Tokio municipal authorities are reported to have agreed to hold the exhibition within or in the vicinity of Tokio, and the Tokio Municipal Council recently voted a contribution of 300,000*l.* The exhibition will be formally opened on April 1, 1912, and is to continue for seven months. At the instigation of the Chambers of Commerce of several of the larger cities of Japan, aided by the civil authorities of Dalny, a commercial exhibition was opened in that city on February 1 last. One building composed of eight rooms is being used for the exhibition. The Japanese Commercial Museum at Mukden has proved to be such a success that it is contemplated keeping it open much longer than was originally intended. The Government and people of Japan are thoroughly imbued with the importance of exhibitions for the display of their products. There is in the city of Tokio a permanent industrial museum under the Department of Commerce, and almost every city of prominence has some form of a commercial museum of a permanent nature. Recently a train was fitted up for the purposes of a travelling exhibition. This was especially encouraged by the Press, and was supported by a number of the leading commercial interests. It travelled over the various lines and was well

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORCKER, Ltd.,

and Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent, where the "Drawwell" can be seen in action.

visited. It is a part of the policy of the Government to assist their merchants by exhibitions of their products, especially throughout China, and wherever a Japanese Consulate is established, there are a number of young commercial students attached to the Consulate, engaged in studying commercial affairs, as well as in developing and assisting in marketing the products of Japan. By this method a great number and variety of Japanese manufactured articles are being distributed and sold in various parts of the Chinese Empire. The Government considers it a part of its functions and duties to encourage Japanese commerce in every conceivable form, and the exhibition spirit seems to be one of the leading methods of rendering aid to Japanese trade. In nearly all these commercial museums and exhibitions the Government's position is that of merely aiding and assisting the manufacturer. A few months ago the Government sent to Manchuria, free of expense, a large body of business men and commercial students. These men were given every opportunity of making a special study of the markets for Japanese products, as well as of examining the possibilities of developing and placing on the markets in Japan the products of Manchuria, and it is largely by such methods as these, and their various museums and exhibitions, that the Japanese are extending their trade throughout the East.

APPLIED ART IN BIRMINGHAM.

In the course of a report to the museum and school of art committee of Birmingham, Mr. H. Wilson offers suggestions which are likely to arouse much interest in educational circles. He dismisses criticism of the result of the past year's studies in a brief but appreciative paragraph. In this he expresses the opinion that the practical application of new motives in enamelwork to the decoration of boxes has been most successful. The damascene work shows very great improvement, and the same must be said of the hammerwork, the repoussé and the engraving. Perhaps the most remarkable advance of the present year has been made in the class for die-sinking. The drawing from plants, living animals, and from the life, all mark new stages of development and are full of promise for the

future, and, he adds, "I foresee a very successful year for the whole school."

The first suggestion Mr. Wilson has to make is that the school should be turned into a day training school for the production of practical workmen in all branches of the jewellery trade. "After a long and careful study of the admirable and varied work of the school during the past year," he says, "one thought prevails. It is this. If such work can be done in evening classes, has not the time come for increasing the utility of the school by adding to the facilities for study open to the students, and by enlarging the range of teaching at their disposal?" This question Mr. Wilson answers in the affirmative, and the suggestion we have indicated is his reply to the further question, "How is it to be done?" It is obvious, he points out, that no student can do his best if he comes to the school after a long day in the workshop. The student approaches his evening task more or less tired, and he has to force himself, or be persuaded, to work, with the inevitable result that his productions look tired and spiritless. Furthermore, there is the danger present in all schools, but most of all in evening schools, of overtaxing tired minds and bodies, and prematurely exhausting the student, and unfitting him for work in after life. Mr. Wilson thinks a beginning might well be made by arranging classes for scholarship students, and also classes for very elementary students selected from the most promising boys and girls in the ordinary elementary schools. This would provide the nucleus of a graded school of real education by the practice of craftsmanship from its simplest to its highest forms. It might even be possible to permit exceptionally endowed boys or girls from the elementary schools to work as half-time students at Vittoria Street, thus getting nearer to that combination of mutual and mental training which is the ideal of every educationist and of every far-seeing employer.

The examiner's second suggestion for the development of the school concerns the staff. He recalls the fact that last year he urged the employment of craftsmen drawn from the countries in which the traditions of handiwork are still alive. "The reasons which led to that suggestion," he adds, "have not ceased to exist; they have acquired strength and insistence in the interval." Mr. Wilson proceeds to deplore the daily encroachment of mechanical

deals of design and workmanship in modern work. On all sides is felt the need for men who not only know their trades, but are enthusiasts in the exercise of them, whose highest happiness is found in the full exercise of their powers. As things are, this need can only be met by the trade schools, such as that of Vittoria Street."

He proceeds:—"If we are to progress towards a healthy and noble national life, we must see that the growing minds of our future craftsmen be provided with the best technical knowledge at our command. It ought, therefore, to be possible to give our students access to the technical resources of the coppersmiths of Italy, Damascus and Cairo, those of the brassworkers of Benares and Chota Nagpur, the damasceners of Cairo, Persia and Cashmere, the goldsmiths of Mysore and Madras, the enamellers of Jeypore and Japan. I do not mean to suggest that we should immediately set to work to copy the productions of any or all of these workers—there has been too much inept imitation in the past—but I do mean that a few master workmen from Syria, India, Persia, or Japan should be brought over, given a bench or floor space in the school, and there encouraged to go on with their inherited crafts, and so doing, to teach that craft in the most perfect of all ways, the daily demonstration of practice. The students would, of course, have the advantage of individual instruction in the handling of material, the use of tools and all those minutiae of the crafts which cannot be acquired from books, nor alas! from our own workmen. The technique, for instance, of incrustation with the precious metals, practised by the Japanese, is unknown in the West. Yet how vast are the possibilities of beautiful work in that craft alone. There is, indeed, hardly a living craft in the East which might not be transplanted with infinite profit to ourselves, our workmen and our art.

"The more this idea of engrafting on our moribund practice the living crafts of living nations is reflected on, the more desirable it will appear from every point of view, and I am convinced (1) that it is the most practical solution of the well-nigh perennial difficulties of craft teaching; (2) that it would provide the nearest approach to the old apprenticeship system with none of its disadvantages; (3) that the presence of foreign craftsmen in the schools would invest work with that romance so dear

and so necessary to the mind of youth; and (4) that we should get some glimpses of that noble ideal of work for work's sake, that worship of workmanship, without which the miracles of ancient Etrusca and Greece, or of modern India and Japan could never have been produced. . . . If this were begun in Birmingham, it would soon become general in England, and by slow degrees the ennobling influences of fine craftsmanship, the refining effects of sincere work would permeate every section of society from the lowest to the highest. The western world, realising once again that the highest beauty is ever within call of sincerity and simplicity, that the highest enjoyment is not to be found in the pursuit of pleasure or riches, but in the realisation of the inner self through work, would gradually attain to that frugality of life and innocence of manners which have characterised the most artistic, *i.e.* the most healthy nations of ancient and modern times.

LESSONS OF THE SAN FRANCISCO DISASTER.*

THE modern city is the creation of commercial needs, and its location is fixed by commercial conditions. The duty of the structural engineer is to so plan all parts of the structure that it shall resist (1) with certainty all definite calls upon it; (2) with no serious injury all probable calls upon it; (3) and without destruction all those occasional visitations that human power can resist. Grouped under the first heading are the live-load, dead-load and the ordinary wind-load requirements, &c.; under the second heading would be grouped such occasional attacks as those of fire, gales and moderate earthquakes in earthquake regions; under the third head occur such disasters as hurricanes and tornadoes, general conflagrations and severe earthquakes, such as at times appall humanity in disasters that are made possible by reason of inadequate design or construction (or both), permitted in order to save a small percentage of expense, but thereby hazarding the integrity of all, with the gambler's chance of some gain or great loss.

ARTHUR L. GIBSON & CO.,

19, 20 & 21, TOWER STREET, UPPER SAINT MARTIN'S LANE, LONDON, W.C.®

Successful resistance to earthquakes, even when severe, is possible; but as this concerns most cities only remotely, it will be passed over with the statement that unified foundations structurally carried to solid material, with a thorough sway-bracing of the frame, will preserve the integrity of a steel building in any probable earthquake; even in masonry walls, bands of metal reduce to small proportions the damage to them from seismic disturbances. It is mainly with the fire lessons that we are concerned, because they are of universal interest and application. It is true that, often when discussing these lessons, we hear the remark that the Baltimore and other fires teach the same facts; but if we analyse more deeply, we must conclude that the San Francisco lessons are unique in giving us generally the effects of fire only, while nearly all others have left the added destructive action of water and steam upon the highly-heated fire-resisting materials.

The main study, then, will be that of different engineering materials with regard to their earthquake-resisting and fire-resisting properties. In view of the general conditions found to exist in San Francisco, as developed by his careful inspection of the city, the writer would impress with all the earnestness at his command the absolute necessity that good construction must follow a good design, or the result is a failure. Faulty design may be partly or wholly redeemed by excellent construction, but a thoroughly good design may easily be utterly ruined by defective construction. These facts are not at all new, but they are so evidently often obscured or ignored that it would be well if they might be impressed with all the vividness of a new thing. The engineer should always see to it that his design is constructed of adequately good materials and executed with the necessary skill and character of workmanship.

Passing the discussion of foundations (not because they are less important than any, but because the superstructure is most exposed to the destructive agencies under discussion), it may be said that wood resists earthquake vibrations well, if the frame and roof are properly tied and braced; the almost universal practice is to ignore such bracing, and then the result is a collapse. In fire, wood, of course, "adds fuel to the flames." Masonry walls of all kinds resist the earthquake usually without destruction if well built, generally with considerable damage; the effectiveness of

resistance is enormously increased with but little expense by improving the weak part of the wall—the mortar—by putting into the mortar a large proportion of Portland cement;* and a further effectiveness of resistance may be secured by metal ties and bands. Against fire, even without the rupturing and exploding action of water from the fire streams striking the highly-heated materials, stone of practically all varieties spalled and disintegrated badly and in varying degrees, enough to require its replacing for the sake of appearance even when it was not structurally incapacitated.

In buildings in which steel enters as an essential structural element, more attention must be given to lateral bracing and to connections to make the structure safely resistant to earthquake vibrations. A more definite lateral stability must be furnished, with less reliance upon the indefinite internal rigidity of the finished structure.

In fire the particularly vulnerable point of buildings of the first class remains the inadequate protection usually made against the introduction of fire from the outside, through windows, doors and inadequately designed roofs which quickly burned away. The protecting effect of metal shutters and metal covering of window trim was great, increasingly so as its character was better, and often so decisively effective as to permit the saving of the building at critical times, as the Kohl building. Even without such protection the decided advantage of wire-glass was shown in a number of cases, as that of the Western Electric Company's building. Although the heat shatters the glass, the wire holds the pieces in place in most instances, so that the flame cannot enter; and although it has the defect of diathermancy, even a weak defence inside may overcome the danger arising from the transmitted heat. It has become evident that, in general conflagrations, fireproof buildings are the innocent victims of outside attack rather than the cause. The conclusion is then inevitable that a very great need in improving conditions is adequate protection of exterior openings.

* The Appraisers' Building, which survived without a crack, was built with brick laid in cement mortar, and is said to have had a monolithic concrete foundation 6 feet thick capping the foundation piles.

Passing without comment some of the lessons driven home by resulting failures, such as the necessity of adequate and correct connections, thoroughly good rivetting, good bond between facing and backing, properly constructed partitions, &c., the general fact is noted that terra-cotta offers much less effective resistance to fire than does reinforced concrete. I can tarry on this lesson only long enough to state that this reference is, of course, only to good materials, well fabricated; and in this connection it should also be stated that critical examinations have indicated grave danger of the gradual scattering corrosion of metal embedded in cinder concrete.

There probably is no more important or instructive lesson to be drawn from this disaster than the imperative necessity of adequate protection of essential metal, whether the metal be a steel frame or steel reinforcement of concrete construction; and a considerable advance has been made in determining with much greater definiteness the details of such requirements. San Francisco's revised building laws, as approved on July 5, 1906, permit of the use of brick, metal-lath and plaster, terra-cotta and concrete. Brick of proper quality furnishes good protection if the minimum covering of the most exposed metal is at least 4 inches and the mortar is of Portland cement. Metal-lath and plaster may, with care, be made efficient, but the wisdom of its permissive use seems to the writer to be doubtful, because the requirements for efficient resistance are so easily slighted; the fact remains that a noticeable proportion of failures in San Francisco were due to a sham application of this kind of protection.

When terra-cotta is used the minimum protection should be at least 2 inches for beams and girders and 4 inches for columns, with especial attention given to proper mortar and to metal ties. It must also be remembered that, where the heat is great, the outer web of terra-cotta blocks shears off and fails, due to the excessive differential expansion of this outside web even when water from fire-streams does not add its rupturing effects by cooling suddenly the highly-heated surfaces; this usually means the preservation of the integrity of the steel frame, but does necessitate an entire reconstruction and replacement of the ruptured terra-cotta.

Concrete or reinforced concrete of good quality both protected the structural metal and usually avoided the

necessity of reconstruction (because the injury to it was superficial, not radical), except when the thickness of this protection was insufficient. In cases where the embedded, protected steel reached within an inch or so of the surface, the fire conditions often ruptured off the thin protecting layer of concrete, leaving the steel exposed. This is especially liable to occur on the under side of floor-beams and girders, where the embedded rods are so near the surface that the highly-heated covering differentially expands considerably as compared with the concrete above the steel, leaving an easily ruptured section in the plane of the reinforcement, where the bars are so numerous as to greatly reduce the area between them of the concrete connecting this outer protecting layer with the mass of concrete above the reinforcing steel.

It is believed that 3 or 4 inches of covering for the metal is as necessary for reinforced concrete construction as for column coverings of brick or terra-cotta in order to give columns adequate fire protection. Tending to confirm this opinion is the fact that as a general proposition, in a temperature of 1,200 to 1,500 degs. Fahr., heat will penetrate concrete to a depth of 2 inches, enough to raise its temperature to 500 degs. Fahr. in less than an hour, while it takes perhaps three hours for this temperature to penetrate 4 inches; this is significant because noticeable loss in strength occurs at about this temperature, which increases rapidly for higher temperatures. For evident reasons the regulation of the item just mentioned must be covered by the building laws of cities in order that it may be made effective, as in the case of so many general requirements necessary for the public safety and welfare.

Hitherto it has been considered that a point of especial vulnerability is the lower flanges of beams and girders. While this fact essentially remains true, it seems that, relatively, more attention must be given to the adequate protection of columns, inasmuch as the failure of one of the lower columns involves not only the loss of it, but also the letting down or destruction of everything above it. The most prevailing cause of destruction and loss in the San Francisco fire, caused by a single class of weakness developing, was due to the partial or complete failure of basement or lower-storey columns exposed to the fire by the destruction of their fireproofing.

I would add, in closing, one reference that concerns engineering in its commercial and business relations. The adequate protection of essential members from fire will add a small per cent. to the cost of a building over its cost if partially protected. This amounts to a few thousand dollars, which looks large to the firm paying for the structure; consequently, as a rule, the firm will take the risk of destruction for the sake of saving this extra initial expense. Were the small additional expense of thorough fireproofing assumed, it would not only decrease the hazard to the owner, but would make the structure a safer risk to insurance companies. Unfortunately, fire-insurance companies will not make public such statistics as they have, giving relative losses on different types of buildings. Yet it is believed that their relative losses on buildings of the first class are much less, proportionally, than is indicated by the somewhat lower insurance rate now prevailing for such buildings. In other words, the reduced hazard secured by thorough fireproofing and fire-protection ought to secure to the owner an insurance rate so noticeably lower that this saving would go far toward compensating him for the extra expense in securing this increased safety. This reduction in rates might well be made still greater when fireproofed buildings are compactly grouped, thus mutually protecting one another. Engineers, architects, insurance men and men of business would probably find that united consideration of this subject would lead to a mutually beneficial adjustment of these interests on the lines indicated.

CEMENT IN CANADA.

THE total quantity of Portland cement manufactured in Canada in 1906 was 2,152,562 barrels, as compared with 1,541,568 barrels in 1905, an increase of 610,994 barrels, or 39.6 per cent. The total sales of Portland cement were 2,119,764 barrels, as compared with 1,346,548 barrels in 1905, an increase of 775,216 barrels, or 57.4 per cent.

Fifteen companies were operating plants during 1906, with a total daily capacity of about 10,500 barrels, namely, one in Nova Scotia, two in Quebec, eleven in Ontario and one in British Columbia. At least four plants were under

construction during the year, of which the total initial daily capacity will be about 4,700 barrels.

Detailed statistics of production in 1905 and 1906 are as follows:—

	1905. Barrels.	1906. Barrels.
Portland cement sold	1,346,548	2,119,764
Portland cement manufactured	1,541,568	2,152,562
Stock on hand January 1	111,446	269,558
Stock on hand December 31	306,466	302,356

Value of cement sold \$1,913,740 \$3,164,807

Some companies do not take stock at the end of the calendar year, consequently their estimates of stock on hand do not always agree from year to year.

The average price per barrel at the works in 1906 was 1.49 dol., as compared with 1.42 dol. in 1905.

The imports of Portland cement into Canada in 1906 were:—

Six months ending June	945,187	\$319,021
Six months ending December	1,485,573	459,685

The year 1906 2,430,760 \$778,706

This is equivalent to 694,505 barrels of 360 lbs. each, at an average price per barrel of 1.12 dol. The duty is 12½ cents per 100 lbs.

The imports in 1905 were equivalent to 917,558 barrels, valued at 1,138,548 dol., or an average price per barrel of 1.24 dol.

There is very little cement exported from Canada. The consumption is therefore practically represented by the Canadian sales, together with the imports.

The following is an estimate of the consumption of Portland cement in Canada for the past six years:—

Year.	Barrels. Canadian.	Barrels. Imported.	Barrels. Total.
1901	317,066	555,900	872,966
1902	594,594	544,954	1,139,548
1903	627,741	773,678	1,401,419
1904	910,358	784,630	1,694,988
1905	1,346,548	917,558	2,264,106
1906	2,119,764	694,503	2,814,267

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

IRELAND.—July 1.—The Kingstown Urban District Council invite competitive drawings for houses for the very poor. The first premium will be 100l. and the second 20l. The selected plans to become the sole property of the Council, and no further remuneration shall be paid to the architect should the Council decide to carry out the works themselves. Particulars may be obtained on a deposit of 1s. with Mr. M. A. Manning, town clerk, Kingstown, Ireland.

IRELAND.—July 2.—The Kilkenny Corporation invite competitive designs for a Carnegie free library, to cost not more than 1,800l. All particulars from Mr. E. O'Connell, town clerk, City Hall, Kilkenny.

WEYMOUTH.—July 30.—The Weymouth Town Council invite designs for a pavilion to be erected on the north side of the pier. One hundred guineas will be awarded for the selected design, such design to become the property of the Council. Mr. H. A. Huxtable, town clerk, Municipal Offices, Weymouth.

CONTRACTS OPEN.

ACCRINGTON.—June 4.—For the erection of brushworks, near Penny House. Apply by letter to Mr. Henry Ross, architect, Cannon Row, Accrington.

BAGULEY.—June 5.—For taking-down Pickie bridge, Shay Lane, Baguley, Bucklow, and rebuilding a new bridge, for the Bucklow Rural District Council. Sub-Offices, Mossburn Buildings, Stamford New Road, Altrincham.

BLACKMINSTER.—June 10.—For the rebuilding in brickwork of Blackminster bridge, near Evesham, and the Littleton and Badsey Railway station (G. W. R.). Deposit 1l. 1s. Mr. J. H. Garrett, surveyor of county bridges, Shire Hall, Worcester.

BRADFORD.—June 5.—For the erection of Muff Field Wesleyan Reform Sunday schools, Bowling Old Lane. Messrs. Walker & Collinson, architects, Cheapside Chambers, Bradford.

Contractors to

H.M. Government.

Chief Offices:

STANDARD BUILDINGS, CITY SQUARE, LEEDS.

BRISTOL.—June 14.—For the construction of the following sub-stations, for the electrical committee:—(1) Oldfield Road, Hotwells; (2) Chalks Road, St. George; (3) Cowper Street, St. George; (4) Cloud Hill, St. George. Deposit 2*l.* 2*s.* Mr. H. Faraday Proctor, city electrical engineer, City Electrical Engineer's office, Temple Back, Bristol.

BROMPTON.—June 4.—For the excavator, bricklayer and mason, carpenter and joiner, plumber and glazier, iron-founder, slater and painterwork required in extension of weaving sheds and alterations to existing buildings at the spinning mills, Brompton, near Northallerton. Forward names to Messrs. Thomas Winn & Sons, architects and surveyors, 84 Albion Street, Leeds.

BURNLEY.—June 3.—For the following works (preferably in one contract) required in the erection of the palace and hippodrome in St. James's Street:—Excavator, mason and bricklayer, carpenter and joiner, plumber and glazier, slater and plasterer, concreter. Application (accompanied by a deposit of 1*l.* 1*s.*) must be made to Messrs. Richard Horsfall & Son, architects, 22A Commercial Street, Halifax.

CARDIFF.—June 4.—For the provision of a refreshment-room at Cardiff station, for the Great Western Railway Company. The Engineer at Newport station.

CARLISLE.—June 3.—For the builder, carpenter and joiner, plumber, plasterer, slater and painter and glazier-work required in extensions at the Carlisle Steam Laundry, Warwick Road. Send names to Mr. Matthew Johnstone, architect and engineer, 22 Lowther Street, Carlisle.

CHELMSFORD.—June 11.—For the erection of a post office at Chelmsford. Deposit 1*l.* 1*s.* The Commissioners of H.M. Works and Public Buildings, H.M. Office of Works, Storey's Gate, S.W.

CHERITON FITZPAINE.—June 14.—For the erection of farm buildings at Stockton Farm, Cheriton Fitzpaine, Devon. Messrs. Cook & Birmingham, land agents, Tiverton.

CHRISTOW.—June 5.—For the erection of a teacher's house and for other work at the Christow Council school, Devon. The Architect's Office, 1 Richmond Road, Exeter.

CODFORD.—June 5.—For building a pair of cottages. Deposit 1*l.* 1*s.* Messrs. Long & Glass, architects, 53 Market Place, Warminster, and 9 The Bridge, Frome.

COLNE.—June 3.—For the construction of a filter and meter house at the Laneshaw reservoir, about four miles from the Colne station of the Lancashire and Yorkshire Railway. Deposit 2*l.* 2*s.* Messrs. G. H. Hill & Sons, civil engineers, Albert Chambers, Albert Square, Manchester, and 3 Victoria Street, Westminster.

CROSBY.—June 14.—For the erection of an elementary school at Crosby, near Scunthorpe, Lincs, for the Lindsey County Council education committee. Deposit 2*l.* 2*s.* Bill of quantities and form of tender may be had on application before May 28 to Messrs. Scorer & Gamble, architects, Bank Street Chambers, Lincoln.

DRIFHLINGTON.—June 3.—For the whole or any of the several trades—namely, bricklayer and mason, carpenter and joiner, plumber, plasterer, slater and painter's work—required in the alterations to the Valley inn, Cockersdale, Drighlington, Yorks; also to the George hotel, Holmfirth, near Huddersfield. Forward names to Messrs. Thomas Winn & Son, architects, 84 Albion Street, Leeds.

ENFIELD.—June 18.—For the erection of a block of schools at Eastfield Road, Enfield Highway. Deposit 3*l.* 3*s.* Applications for bills of quantities should be sent before May 31 to the architect, Mr. G. E. T. Laurence, 22 Buckingham Street, Adelphi, W.C.

EXETER.—June 3.—For alterations and additions to Hoopern farmhouse, Pennsylvania. Messrs. Ellis, Son & Bowden, surveyors and architects, Bedford Chambers, Exeter.

FELTHAM.—June 11.—For alterations to nine classrooms at the Feltham industrial school, Middlesex, consisting of the insertion of new windows and air flues, and decorative work consequent thereon. The Architect's Department, 15 Pall Mall East, S.W.

FLAMBRO' HEAD.—June 3.—For the erection of a fog-signal house, alterations to the existing dwelling, &c., on Flambro' Head, Yorks. Deposit 1*l.* The Corporation of Trinity House, London, E.C.

GLASGOW.—June 7.—For the following works in connection with C block (nurses' home), D block (power-house, and E block (laundry) at the Glasgow Royal Infirmary:—(1) Digger, mason, brick and steel; (2) carpenter, joiner and

UPMINSTER, Essex, is a quaint old-world village situated about 15 miles from the City of London, with a first-rate train service by the London, Tilbury and Southend Railway. Messrs. W. P. Griggs & Co., Ltd., builders, of Ilford, are laying out a large estate in this beautiful locality, and as fast as they can erect the houses they are being sold. No doubt the two principal reasons for this success will be the fact that each house has a frontage of from 40 feet to 80 feet and a depth of 250 feet to 300 feet. The cost of a freehold house is from about 600*l.* to 1,050*l.*, and this ideal spot is situated within 35 minutes of the Metropolis. An excellent description of Upminster appeared in the *Building Trade* of Wednesday, May 22.

THE Court of Common Council have given instructions for the taking of returns as to the pedestrian and vehicular traffic over the site of the proposed station at Lothbury, also as to the use of the subways in front of the Mansion House, at a cost of 75*l.*, in connection with the Corporation's opposition to the Great Northern Railway and City Railway Bill in Parliament.

THE *Daily Telegraph* is officially informed that the contract for the new Admiralty buildings at Spring Gardens has been let, and that building operations will be commenced immediately the preliminaries of signing the contract have been settled. The total cost of the new buildings will be 130,000*l.* The contract for its construction was let in two parts—that for the foundations at a cost of under 30,000*l.*, and that for the superstructure in Portland stone at between 95,000*l.* and 100,000*l.* Messrs. Mowlem & Son, the Westminster contractors, obtained the contract for the foundations, and it is understood that the same firm will now complete the superstructure.

TRADE NOTES.

MESSRS. PARNALL & SONS, LTD., shop-fitters, of London and Bristol, send us a very chaste design of a cash office, of which they are making a specialty. The design can be

varied to harmonise with the interior fittings of the shop, and is suitable for drapers, chemists, and any other retail trades.

WE are informed that Mr. W. A. Osborne, who has represented Mr. Joseph F. Ebner for the past twenty-three years, has resigned, and is commencing business on his own account.

THE Heston schools, Hounslow, have been ventilated on the "Boyle" natural system, under the direction of Mr. Lancelot Lang, architect, Hounslow.

THE Matterdale new schools are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE firm of McTear & Co., of Belfast, have long held a reputation for their iron roofs. Mr. Alexander Burns, who was manager of that department during several years, has commenced business in Belfast under the title of the Rex Roofing Co. Besides roofing, the erection of shedding and workshops complete will also be undertaken. All who know Mr. Burns will wish him success in a business in which he ranks as a specialist.

WE have received a communication from Ellkay & Cornes, Ltd., informing us that Mr. James Cornes has now no interest in the management of that company, and that by an agreement which has been entered into his connection has entirely ceased. The company are supplying a combination range, copper and bath called the "Lanco," which, it is claimed, is an improvement on the combination previously supplied, and is the result of exceptional and practical experience in the needs of artisans' dwellings, miners' cottages, bungalows, &c. The company's title is to be changed to "Ellkay & Co., Ltd." The registered office will still be Bath House, Holborn Viaduct, but increased accommodation has been taken for London stock, general office, warehouse and show-rooms, where samples of their specialties may be seen, of which notice will shortly be given.

THE Duke of Norfolk last week presented Mr. J. G. Russell, who for a period of fifteen years and nine months has been manager of the works at the castle, with a silver bowl of antique design. Mr. Russell is leaving owing to the completion of the work. At one time there were 350 men under him, and for a number of years over 250 men were regularly employed.

VARIETIES.

MESSRS. WESTINGHOUSE & Co. have obtained the contract for the construction of an electric tramway system for Genoa. The contract is worth about 3,000,000 dols.

THE Model Cottage exhibition which was to have been opened in July at Newcastle-on-Tyne has been postponed until May 1908.

THE Littlehampton Urban District Council on Tuesday adopted a new scheme presented by Mr. Barrett, the engineer, for the drainage of Wick and a portion of Littlehampton, which is estimated to cost 16,000*l*.

THE extension of the G.P.O., Cardiff, overlooking Park Street, will take about nine months; the cost will be over 20,000*l*. The contract has been given to Messrs. Wm. King & Son, of Vauxhall Bridge Road, Westminster.

MAJOR J. STEWART, Local Government Board inspector, held an inquiry at Redditch, on Tuesday, into an application by the Redditch District Council for sanction for a new loan of 7,500*l*.—4,000*l*. for electricity undertaking extension, and 3,500*l*. for the provision of a refuse destructor in Summer Street.

THE Mysore Government, observing that no definite system is at present followed by the several municipal boards in the State in the matter of the preparation of estimates for municipal works and their execution, have caused to be issued definite instructions in the matter, with a view to remedy this defect and insure uniformity of practice in all municipal towns.

THE Board of Education have issued a list of the first circulating collection of water-colour paintings of the British school, which will be useful to authorities who desire to utilise the boon, which is easily obtained. There are 264 drawings, ranging from an example by Francis Barlow, who died in 1702, to one by William Simpson, who died in 1899. In fact, the progress of the art is fully exemplified. There are four drawings by Turner, three by Copley Fielding, two by David Cox, three by Samuel Prout. Architecture is well represented, for there are drawings by John Buckler, the Pugins, W. W. Deane, Louis Haghe, David Roberts and others.

THE Local Government Board have sanctioned the borrowing by the St. Helens Corporation of 48,000*l*. in connection with the Parr and Sutton intercepting sewer, and also 750*l*., the amount overspent on the Robins Lane sewer. At last week's meeting of the health committee, the borough surveyor was instructed to go over the levels again of the proposed Sutton sewer, and to prepare specifications for the tenders.

THE Glasgow Corporation have agreed "that it be remitted to a committee to consider and report as to the expediency of promoting legislation whereby lands and heritages, or any part or parts thereof, required for street and other improvements, can be compulsorily acquired on fair and equitable terms, and by a less cumbersome and costly process than that which prevails under the existing statutory law."

IN connection with the "City Beautiful Conference" to be held shortly in Liverpool three prizes have been offered by Mr. Meade-King, of the value of 5*l*., 2*l*. and 1*l*. respectively, for the three most beautiful private house fronts in Liverpool; and also three similar prizes for the three most beautiful shop or business fronts, consideration being given mainly to what the competitor has himself done to beautify the premises.

ON the application of Sir Augustus Webster, tenant for life of the Battle Abbey estate, Mr. Justice Neville, in the Chancery Division, has sanctioned a proposed agreement with a syndicate to bore the estate for the purpose of ascertaining whether the shale recently discovered there is in paying quantities. If so, a company will be formed with a capital of 40,000*l*. to work the shale and any oil, natural gas and minerals discovered. The agreement provides for the payment of certain rents, royalties and a percentage of the profits to the lessor.

THE Glasgow Corporation having remitted to the sanitary inspector, the gas engineer and the Corporation chemist to report regarding the effect on the atmosphere of the more general use in dwelling-houses of gas stoves for cooking purposes, have agreed that two houses in the Improvement Trust property in High Street be taken for a period of six months, at a rent of 9*l*. each, for the purpose of conducting experiments.

ASPINAL'S ENAMEL, LTD NEW CROSS, LONDON, S.E.

THE new Wesleyan church at Pirton, near Hitchin, was opened on Wednesday, May 29, by Mrs. Smart, of Stevenage, and the Rev. Albert Clayton, the president of the conference, preached the dedicatory sermon. A public meeting was held in the evening, the chair being taken by Mr. Percy Blundell, of Luton. The building consists of a church 43 feet long by 27 feet wide, seating 220 adults, or about 256 in a mixed congregation. The church has three arches at pulpit end on columns, the central arch opening into the choir with a handsome traceried window in gable, and the two side arches opening into two vestries, which are shut off from the church and choir by swivel partitions, but can be thrown into it for extra accommodation when required. The seating and roof timbers are of pitch pine. Separate porches lead to the vestries. A bold narthex projects in front of church with wide doors, and a five-light traceried window in gable above, flanked by two bold angle buttresses. Low-pressure hot-water heating and ventilation on modern principles are provided. The church stands on an open site, well set back from and raised above the road, showing the building to advantage. The exterior is faced with red bricks, with sand-faced terra-cotta dressings, lead lights with rich-coloured glass in the windows. The works have been carried out under contract at 97½ per cent. from the design and under the superintendence of Messrs. George Baines & Son, architects, 5 Clement's Inn, Strand, London.

NEW CATALOGUE.

ELEGANCE is the principal characteristic of the examples of fibrous plaster decoration and of work in other materials found in the catalogue of Messrs. H. E. Gaze, Ltd. The treatment is sufficient to explain why the firm has contributed to the decoration of so many important buildings. We doubt whether any French firm could surpass some of the modelling in caryatides, plaques, trophies, which are shown. The ceiling mouldings and cornices by themselves would impart distinction to a room, and the friezes are no less effective. Good taste prevails throughout the designs, and therefore all of them can be adopted by architects for modern Renaissance buildings. New works have been erected for the firm to which architects can have access for

examining decoration in progress, and especially when their own designs are being carried out.

A TEST ON A REINFORCED CONCRETE FLOOR.

AN interesting and satisfactory loading test was carried out on a vacant site in Walworth on Tuesday, May 14, for the purpose of proving to the satisfaction of Mr. Arthur C. Blomfield, M.A., F.R.I.B.A., architect to the Governors of the Bank of England, the efficiency of reinforced concrete floors constructed on the Kahn system. The test was conducted in the presence of Messrs. William Dunn, F.R.I.B.A.; J. Rutherford, architect, H.M. Office of Works; P. H. Johnson, A.M.I.C.E., of the Midland Railway; C. J. South, A.M.I.C.E., of the Great Western Railway; Benjamin Hannen, and representatives of the Associated Portland Cement Manufacturers, in addition to Mr. Blomfield.

The test floor was constructed in accordance with the working drawing reproduced. It will be seen that the floor slab was supported by main beams and a wall, and in the centre by a subsidiary beam 15 feet 9 inches span, 12 inches wide by 20 inches deep, reinforced with two 1½-inch Kahn trussed bars. It was this subsidiary beam which was really under test, and its allowable deflection was specified not to exceed $\frac{1}{100}$ of the span, i.e. $\frac{1}{100} \times 189 = \frac{1}{10}$ inch, with a load of 450 lbs. per foot super. The decking slab was 5 inches thick, reinforced with ½-inch Kahn trussed bars spaced 12 inches centre to centre.

As regards the materials used, the aggregates consisted of crushed Thames ballast and sand, while the cement was "Ferrocrete." Two parts of the ballast were mixed with one of sand, and five parts of the final mixture were mixed with one of cement, so that the proportions of the concrete were 3½ ballast 1½ sand to 1 of cement. The age of the floor at the time of the test was 67 days. The reinforcement throughout consisted of Kahn trussed bars.

The load was applied by means of bricks piled upon an area measuring 15 feet 9 inches by 13 feet = 204½ square feet. The deflection was taken at two points, namely, one at the centre of the subsidiary beam in the centre of the floor slab and the other at the centre of the end main beam. These two deflectometers consisted of levers which, in

recording, multiplied by ten the actual deflections of the beams. The deflection of the subsidiary beam was obtained by deducting from that registered by its deflector the amount of the deflection shown by the deflector under the main beam. The arrangement of the test

no deflection in the secondary beam. Eventually a load of 125,290 lbs. was evenly distributed over the area, giving a load of 612 lbs. per foot super. The deflection was ascertained to be $\frac{1}{8}$ -inch. As the clear span of the beam was 15 feet 9 inches = 189 inches, the deflection was therefore

and the position of the deflection-registering instruments are shown in the general photographic view.

The slab was first loaded with 300 lbs. per square foot, for which it was designed. This load produced practically

$\frac{1}{8} \times 189 = 18.125$ part of the span. As stated above, the allowable deflection under the load of 450 lbs. per foot super was $\frac{1}{8}$ of the span, so that the floor made a good showing.

A FOLDING DRAWING-STAND.

ALTHOUGH trestles are largely used to support drawing-boards, there can be no doubt about their inconvenience. Offices, especially in London, are usually limited in area, and a pair of trestles, when not in use, occupy too large a share of it. Then in many houses floors are not perfectly horizontal, and it is not easy to have the steadiness that is desirable when drawing. The Alliance folding drawing-stand, which has been introduced by Mr. W. H. Harling,

FIG. 1.

completely surmounts all the inconvenience which is inevitable with wooden trestles. In the first place, it is a complete stand which can, if desired, be used as a trestle. It can therefore be employed by photographers as well as draughtsmen. As the supports are adjustable, a camera or a drawing-board will be as steadily supported on uneven ground or on an inclined floor as in cases where the ground or floor is perfectly horizontal. As all the supporting parts

are made of metal, only a minimum amount of space is required. When out of use the stand can be folded, and then the depth is only 3 inches. Fig. 1, having a top $19\frac{1}{2}$ inches by $20\frac{1}{2}$ inches, is adapted to hold imperial drawing-boards; while Fig. 2, having a top of $21\frac{1}{2}$ inches by $26\frac{1}{2}$ inches, will carry double-elephant drawing-boards, and is therefore suitable for general use in the offices of architects and engineers. The two sizes are always kept in stock, but larger sizes can be obtained on order. The

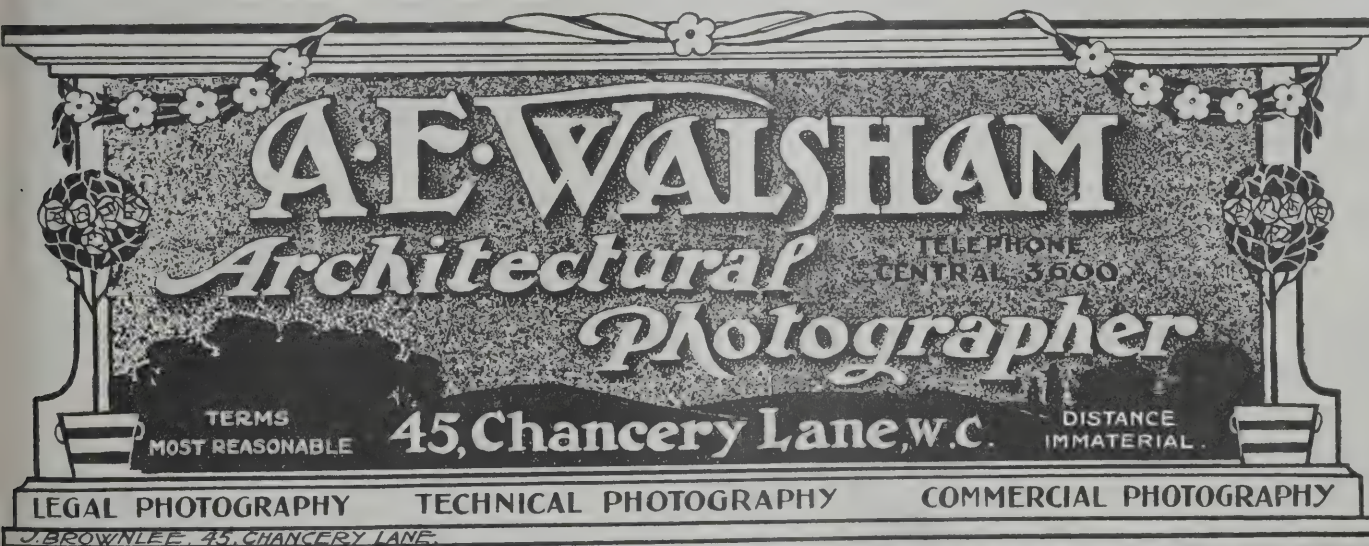

FIG. 2.

stand is $29\frac{1}{2}$ inches in height, but it can be raised to 4 feet or 4 feet 8 inches without any loss of rigidity. The drawing-board can be fixed either horizontal or inclined, as desired. The new stand will be found a capital substitute for the cumbersome wooden trestles; and as there can be no warping of material it will always remain in its normal state. It will be found an acquisition in all offices whether large or small.

Back Volumes of **THE ARCHITECT** will be found to be of great value to you, containing as they do fine examples of measured drawings, perspective work, and details; all of importance to you in your studies. **Call at the Offices, 6-11 Imperial Buildings, Ludgate Circus, E.C.,** between the hours of 10 A.M. and 5 P.M. on any day but Saturday, and ask for some back volumes to look through. Cost of each volume, containing over 100 examples, is 12s. 6d.

P. A. GILBERT WOOD, Publisher.

"MINERVA" PAINT.

THE increasing popularity of "Minerva" paint, "Satinette" and the other specialties manufactured by Messrs. Pinchin, Johnson & Company, Limited, 23, 24, 25 Billiter Street, E.C., has made it necessary for the firm to look out for new London offices, as those in Billiter Street are not nearly large enough to cope with the demand upon space. We understand that negotiations are now in progress to acquire an extensive site near by—two complete buildings of five floors each, where it is intended to keep a good stock of the different specialties so that urgent orders can be despatched direct from the City office instead of from the works at Stratford. A handsome show-room and a permanent exhibit is also contemplated, so that intending users of paints, enamels, &c., will be able to see specimens of work actually done. A telephone, writing materials and accommodation will be at the disposal of visitors, and these little conveniences will we are sure be much appreciated. And as the proposed premises are near the Baltic Exchange and in close touch with the markets, busy men will be able to "look in" when in the City. We expect to be in a position to give further particulars, address, &c., shortly.

HOUSING PROBLEM IN GERMANY.

ALTHOUGH during the past year no laws were passed in Germany which could be said to have solved the difficult problem of hygienic house accommodation, still earnest endeavours were made through the so-called "kleinen mittel" (petty measures) at least to palliate the evil. Among these "petty measures" are reckoned all administrative decrees issued with a view to the improvement of dwellings (more especially for the poorer classes) without any radical interference on the part of Parliamentary legislation. First and foremost must be mentioned the activity of the Government authorities and municipal corporations for the purpose of providing suitable dwellings for their officials.

Besides the Imperial Home Office (Reichsamt des Innern) the Imperial Postal Administration also has for some time past devoted its attention to the question of dwelling accommodation. At first dwellings were provided for subordinate officials in small country towns and at remote railway

stations. In the year 1902, however, the matter of house accommodation in urban districts was placed in the hands of the General Post Office, and since then no less than 300,000*l.* have been expended by this department in buying dwelling-houses or renting apartments. For this sum were purchased 515 houses—in about 700 places or localities—comprising 1,365 family tenements or flats and 93 rooms for unmarried officials, and 215 houses were rented with 545 family tenements and 67 apartments for unmarried officials. These houses, chiefly situated in East Germany, resemble in size and general appointments healthy workmen's dwellings and with each "wohnung" or family tenement in rural districts is included a piece of arable land.

By a law promulgated on July 16, 1906, the Prussian State granted the sum of 750,000*l.* for improving the housing accommodation of its subordinate officials and employes, 3,700,000*l.* having previously been expended for the same purpose. Five-sevenths of this amount has been appropriated for railway employes (two-thirds served for the erection of fiscal buildings), whilst the remainder was applied for the benefit of officials in other Government departments. With the money hitherto expended for this purpose by the Prussian Government some 20,000 sets of apartments have been provided, so that the Government contribution for each dwelling amounts to about 185*l.* The 750,000*l.* recently granted will, in all probability, suffice to procure another 4,000 dwellings or flats. It may here be mentioned that in consequence of the steady rise in house rents that part of the salary of Prussian sub-officials which represents the Government allowance for rent was last year increased by 50 per cent.

Next to the Imperial Government and the Government of Prussia, the kingdom of Bavaria has been foremost in providing dwelling accommodation for officials. It has been at pains not only to provide healthy accommodation for officials, but also to grant loans at low rates of interest to the Government officials' building societies, and upwards of 175,000*l.* were devoted to this purpose in the course of the last few years.

The second of the "petty measures" consists in supporting the so-called workmen's building societies, comprising persons of limited income irrespective of calling or profession. These organisations, being formed on the

Are you interested in WOOD PRESERVATION?

ANTHROL protects all varieties of wood from decay, whether the situation be damp or dry, and from the ravages of all wood-destroying insects, including the white ant on shore and the teredo in sea water. Rats will not gnaw wood which has been treated with ANTHROL. Full particulars and prices will be sent on application.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. ANTHROL does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, ANTHROL, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The **ANTHROL** COMPANY, Kinning Park, GLASGOW;
and 6 Crosby Square, LONDON.

principle of self-help and having purely benevolent aims, are all flourishing, chiefly as a result of the great assistance accorded them by the Federal Governments and municipal authorities in the shape of cheap credit and low-priced building sites. At the present time more than 700 mutual benefit building societies, with about 120,000 members, are carrying on their work for the public welfare. Latterly the State insurance institutes (Landes-Versicherungs-Anstalten) have rendered them special pecuniary assistance.

Considerable progress has also been made with regard to the official inspection of dwellings. In Bavaria and Hesse a chief inspector of dwellings was last year appointed in addition to the already existing local inspectors; his duties are to instruct and advise the latter and to assist the building societies as far as possible, and, being also in the service of the Federal Ministries of the Interior, this official will form a permanent link between the Government and the housing commissioners.

In Rhenish-Prussia, too, the communal authorities are actively engaged in promoting the effective inspection of dwellings, the town of Essen—which has become so well-known through the great Krupp works and which contains upwards of 231,000 inhabitants—being particularly active in combating the existing hygienic and moral evils by means of dwelling-house inspection.

WORKMEN'S COMPENSATION ACT, 1906.

THE committee of the Berkshire County Council report that they have considered the Workmen's Compensation Act, 1906, and its application to the staff of the Council's highways and bridges department. They are advised that with the exception of the county surveyor, who being a person employed otherwise than by manual labour whose remuneration exceeds 250*l.* a year is outside the scope of the Act, the whole of the staff, including those employed in the office as well as those working on the roads, will come within the definition of "workmen," and be entitled in certain events to compensation under the Act; and that the definition of the word "employer" includes a County Council, the exercise of their powers and duties being treated by the Act as their "trade or business." It appears

also, though the point is open to some doubt, that in certain cases workmen in the employ of contractors with the Council for haulage or bridgework or similar purposes might be entitled to claim compensation in the first instance from the Council, the Council being entitled to be indemnified by the contractors. The amount of compensation might in certain events amount to 300*l.* in case of death or in case of incapacity for work to a weekly payment of 1*l.* a week during incapacity, and the latter liability, if not redeemed, might continue for life. The liabilities of the Council will therefore be considerable, and the committee advise that an assurance be effected against all liabilities, whether arising under the present Act, the Employers' Liability Act or at Common Law. As the Act will come into operation on July 1 next, and the insurance companies have only recently settled their forms of policy and rates of premiums, the committee ask for authority to select an insurance company and to take the necessary steps to effect the policy.

THE GERMAN CEMENT TRADE.

THE struggle last year in overcoming the period of depression was more protracted and severe in the cement trade than in nearly all other branches of German industry. Unhindered over-production and ruinous competition had affected the trade to such an extent that it began to recover gradually only after the majority of other industries had already for some time enjoyed the benefit of the general economic improvement. This recovery was accelerated by the boom in the building trade, and plentiful orders for large quantities of cement from various foreign countries, and, as a result, most of the works succeeded in increasing their sales during the year under review. Owing to the growing activity in the building line, which was not disturbed by lock-outs, as in the previous year, both the demand at home and the exportation to foreign countries—which was particularly large to San Francisco and Valparaiso—attained considerable dimensions. The active exportation had, moreover, the effect of diminishing the competition of the works on the home market; those in West and Central Germany endeavoured to lessen competition by mutual price conventions, and the

Rhenish-Westphalian Syndicate actually succeeded in raising the price of cement from 17*l.* 10*s.* to 20*l.* and 20*l.* 3*s.* per double truck. Nevertheless, the prevailing conditions of competition gave rise to many complaints; on the one hand, the swelling of the ranks of producers by the continual establishment of independent new cement works naturally still more handicapped the syndicates which, by reason of their numbers alone, are already much restricted in their efficiency; whilst, on the other hand, Belgium in the West and Austria-Hungary and Russia in the East dump their produce over the unprotected customs frontiers into Germany. The position of the works in Upper Silesia became particularly unfavourable. Since the commercial treaties accorded all most-favoured-nation countries exemption from duty for cement, these works had to suffer most acutely by reason of the competition of the extremely efficient Austrian concerns, which are united in a powerful cartel. This cartel and one of the Austrian factories near the frontier could only be met by the Upper Silesian works paying them a considerable indemnity, and also by the latter undertaking to diminish their exports to Austria-Hungary. Russia also threatened to compete with the East German works. Protected by Customs rates, which much impaired the importation of German cement, the Russian works were active in their endeavours to dispose of their produce in Germany. The fact that competition from this quarter did not become more formidable was only due to the internal political disturbances, which naturally much impeded the efficiency of the Russian cement industry.

DRAINAGE OF PRETORIA.

In the report of the Pretoria Sewage Disposal Commission which has just been issued, it is stated that at present Pretoria has no sewerage system. The Town Council proposed to sewer the town, to conduct the sewage by gravitation through Daspoort, to treat it in septic tanks and filters, and to discharge the effluent from the filters into the Aapies river or to apply it to irrigation. The objections brought against the scheme were as follows:—That the treatment of sewage at the site proposed will cause annoy-

ance to neighbouring residents; that to turn the effluent into the Aapies will constitute a danger or an offence, or both, to residents lower down the river; that the proposed storm overflow will contaminate the river with crude sewage; that the erection of the proposed works will depreciate the value of adjacent property; that the Council can only justify establishing sewage works on this site against the will of the owner and of the neighbours by showing that no other site is practicable, and that they have failed to show this; that it is in any case unnecessary to expropriate so large an area.

The Commission then state:—Apart from the objections, we see no reason to doubt the general propriety of the scheme. No one has denied that a sewerage scheme of some kind is necessary, and bacterial treatment is a recognised method of dealing with the problem. The real question is as to the validity of the objections.

The conclusions of the Commission are as follows:—The scheme will probably be the cause of occasional annoyance to persons residing in the immediate neighbourhood of the site. The effluent will not appreciably injure the river. The storm overflow at Daspoort is unnecessary and should be abolished. The erection of the proposed works will substantially depreciate the value of adjacent property. The Council have failed to satisfy us that the location site will not meet all reasonable requirements. It is not strictly necessary to expropriate so much ground, but it is desirable, as much in the interests of the objectors as in those of the Council. In conclusion, the Commission state that they could not recommend His Excellency the Governor to sanction the proposed scheme.

AS AMERICANS SEE US.

THE deputy-consul of the United States at Birmingham, Mr. Ernest Harker, reports that continuous building operations in the district create a market for large quantities of construction materials.

For the fiscal year 1905-6 there were erected in Birmingham 1,180 houses and shops, 44 factories, 18 business premises, 6 churches and schools, 177 miscellaneous buildings, while 212 buildings were altered or enlarged. The

GILBERT WOOD & CO. Ltd., 6-11 Imperial Buildings, Ludgate Circus.

city has 540,000 inhabitants and is still growing. Coventry, a neighbouring city, is also expanding, due to the rapid growth of the motor-car industry.

The total value of sawn, split, planed or dressed wood imported into the United Kingdom during the calendar year 1906 amounted in value to 90,195,507 dols., against 74,241,522 dols. the year previous. The receipts from Russia increased from 24,150,454 dols. to 29,069,064 dols.; from Sweden, 16,751,597 dols. to 19,481,926 dols.; from Canada, 15,901,340 dols. to 20,382,780 dols.; and from the United States, 8,241,642 dols. to 9,976,160 dols. The major part of this wood was for building purposes. There seems to be no reason why American lumbermen should not be shipping more well-seasoned wood in the form of floor joists, boarding for floors, beams and rafters for roofs, mouldings for window and door frames, matched boards for lining, doors, &c.

Considerable timber in the hewn state is also imported, the values in 1906 having been 18,009,500 dols. of hewn fir, oak and teak wood, and 13,202,834 of pit props or pit wood. The United States leads in the supply of the former, furnishing 4,260,752 dols. worth last year. The Vice-Consul forwards a manufacturer's wholesale selling price list of building hardware, which is available to the American trade at the Bureau of Manufactures.

The Consul, Mr. Albert Halstead, of Birmingham, suggests:—

"With proper cultivation of the British field the American proportion of wood and timber imports can be increased. Freight from the United States is necessarily a most important item, but if the slower vessels, including those of the tramp order, were used, American wood and timber should be able to compete on practically equal terms with that from Russia and Canada, though Scandinavian timber must always have a decided advantage.

"Only seasoned timber should be shipped, because this is a very damp climate, and wood that is not properly seasoned very often swells and gets out of shape. Lumbermen who would sell timber profitably in the United Kingdom must be prepared to keep large stocks on hand, that they may be able to fill orders without delay. A seaport should be selected for lumber storage purposes, so that by sea or rail other ports and the interior can be easily reached

and orders filled promptly. The time required to deliver lumber from the United States upon receipt of an order from the United Kingdom is too great to obtain all the possible trade in lumber, unless large stocks are kept here. At the same time lumber merchants must be prepared to give long credits and adapt themselves fully to British commercial conditions. Nor can they expect satisfactory results if they attempt to sell by the correspondence method. They must have agents or representatives on the ground.

"As to what is called in England 'builders' ironmongery,' it is imperative that such materials should be kept on hand in the United Kingdom at some central point, so that orders can be received and goods delivered promptly, because merchants who deal in hardware—and this really applies to all kinds of merchants in the United Kingdom—do not carry large stocks, but order as needed. They expect manufacturers or factors to be ready to supply them promptly."

BUSINESS IN CHICAGO.

ACCORDING to the report of Mr. Consul Finn on the trade of the Chicago district, one of the curious phases of the present prosperity of the United States is the number of vacancies in the public service—federal, State and municipal—and the few persons offering themselves for examination for these posts. These vacancies are caused by so many of the clever men who have held these positions having been induced to leave them by the much larger salaries offered them by the important firms with which they come in contact, salaries which they can never get from Government; on the other hand, a considerable number of men of ability enter the public service in the hopes of, in time, getting one of those good mercantile posts. The dearth, however, of applicants recently caused the postponement of examinations advertised to be held in Chicago for posts with salaries from 200*l.* a year upwards. He continues:—I have no means of knowing what British money is being invested in here, but from inquiries as to companies of all kinds in which people have put their money, and who later on write to the Consulate for information as to their investments, I know that much money is invested in wildcat schemes, often by people who

can ill afford to lose it. Safe investments can be obtained here which will return from $4\frac{1}{2}$ per cent. to 6 per cent., but after that every increase in percentage promised means increased risk.

A demand for many British goods could be created by proper advertising. In 1906 His Majesty's Government sanctioned my devoting a part of the Consulate to exhibiting samples of goods, photographs, catalogues, &c., but the British merchant has been slow to take advantage of my proposal. Barbadoes, however, has sent samples of different products, and a number of inquiries about quantities available and prices have been made by local merchants with a view to business.

Such a sample-room or permanent exhibition of British manufactures, not heavy machinery or such articles, could, I am positive, prove of great benefit, but it must have the support of the British manufacturer who will keep his show of examples up to date. This plan of bringing and keeping the manufactures of a country before the public is being very strongly advocated by the United States consuls as the best way to bring the goods of their country before the public of other lands, and in several places in the United States European countries have some association of commercial agents who exhibit samples with good results. The British merchant is holding his own in this market as compared with other countries, but could do better if he would only adapt himself to the methods in vogue here, and to do this he must advertise, and for some articles he could, through an agent here, do a large mail order business. This idea has been brought before more than one British manufacturer but without success. The American manufacturer advertises all through the British empire, while European houses practically leave the United States alone.

The future of Chicago as the centre of the iron and steel industry would seem to be assured with the commencement of the building of the works of the United States Steel Corporation in Gary, Indiana, only a few miles from Chicago.

It is estimated that 1,500,000 tons of rails were rolled for Western railroads, more than half of which had to be brought from the Eastern States, but the new works will have capacity to supply this amount annually, and as half or more of the bars, structural shapes and plates used in

the West also have to be ordered and rolled further East the economy of having the new plant can be easily realised, while the erection of another plant is under consideration at or near Duluth, close to the mines.

During the year two blast furnaces, with an annual capacity of 300,000 tons, were completed; seven with a capacity of 1,100,000 tons were commenced, and seven with the same capacity are projected. Four of these are under construction and four projected at Gary. Eight 50-ton open-hearth furnaces, seven at South Chicago, with a capacity of 210,000 tons, were completed, while twenty-eight 60-ton furnaces are building at Gary, three 50-ton ones close by; twenty-eight more 60-ton ones are to be built during the year at Gary.

The United States Steel Corporation now produces about 75 per cent. of the output of this district, and when their projected schemes are completed will have 85 per cent., while next year the plant at Gary, which is termed "The Indiana Steel Company," should be able to turn out 1,500,000 tons.

They are also building rail mills at Gary with a monthly capacity of 75,000 tons, and at Chicago with 7,500 tons. Plate mills at Gary, monthly capacity 25,000 tons; and at South Chicago 7,500 tons. Steel bar mills at Gary, four mills, 14 inches, 12 inches, 10 inches and 8 inches respectively, with a monthly capacity of 30,000 tons; a track bolt plant at Jonet, Illinois, with an annual capacity of 240,000 kegs, and a pace bar plant of 120,000 tons. Cooling beds are being built at Milwaukee with sheer tables and blooming, slabbing and billet mills at Gary. The International Harvester Company and the Inland Steel Company at Indiana Harbour are each building bar mills of 6,250 tons monthly capacity, while the American Rolling Mills Company is putting up mills to roll iron bars with 4,000 tons capacity.

The great development of the year has been the increase in use or construction of open-hearth furnaces, twenty-one having been completed with an annual capacity of 873,000 tons, forty-seven under construction estimated at 2,189,360 tons, and those interested have decided to build seventy-six more with an output of 4,500,000 tons in the near future, while only one important addition of a Bessemer plant with an output of 300,000 tons has been made in Ohio.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

IRELAND.—July 1.—The Kingstown Urban District Council invite competitive drawings for houses for the very poor. The first premium will be 100l. and the second 20l. The selected plans to become the sole property of the Council, and no further remuneration shall be paid to the architect should the Council decide to carry out the works themselves. Particulars may be obtained on a deposit of 1s. with Mr. M. A. Manning, town clerk, Kingstown, Ireland.

IRELAND.—July 2.—The Kilkenny Corporation invite competitive designs for a Carnegie free library, to cost not more than 1,800l. All particulars from Mr. E. O'Connell, town clerk, City Hall, Kilkenny.

WHITEHAVEN.—June 17.—For the erection and completion of a mixed secondary school. Deposit 2*l.* 2*s.* Messrs. Grayson & Ould, architects, 31 James Street, Liverpool.

THE Dundee Technical Institute committee have finally approved of the plans of Mr. J. Langlands for the erection, at a cost of 45,000*l.*, of a new Technical Institute for Dundee. The style adopted is a Classic Renaissance, the façade being divided into three bays. Under the centre bay is the main entrance and vestibule, leading to the inner hall, from which runs the main stair. To the right and left of the main entrance are the library and examination hall, directors' room and offices. On the first floor are the board-room and four lecture-rooms, and the second floor is wholly occupied by the art department. The art department contains a large art hall with two painting annexes, lecture-room and classrooms for architecture, design and life classes.

DR. LYSTER, medical officer to the Handsworth Urban District Council, in his annual report upon the sanitary condition of the district states, in regard to new streets and new buildings, that during the year he reported two sites to the plans and buildings sub-committee as undesirable for building purposes, and likely to lead to bad health of the persons occupying such houses. "It is a deplorable fact," he says, "that such sites are attractive to the makers of ground rents on account of their low price, and houses that are erected on these and other sites only just fulfil the bare requirements of the local by-laws. Partly owing to the bad state of repair into which these houses rapidly fall, and partly owing to the special situation of some of such houses, there are now parts of the district rapidly degenerating into slums." Under the present systems of road and house planning and construction this is inevitable, and as a large proportion of land in Handsworth still remains unbuilt upon, the medical officer suggests that additional powers in the direction of town planning should be asked for, as well as power to restrict the number of houses per acre, and to provide for open spaces.

CORRESPONDENCE.**A Folding Drawing-Stand.**

SIR,—I have to thank you for your notice of my drawing-stand on page 21 in your issue of May 31. I would, however, call your attention to the fact that by an error you omitted my address. I should therefore be glad if you would kindly insert this letter, pointing out that my address is 47 Finsbury Pavement, London, E.C., and I shall be most happy to send my list with prices to anyone who may desire to receive it on hearing from them.—Yours faithfully,

W. H. HARLING.

The National Association of Master Monumental Masons and Sculptors.

SIR,—The first general meeting of the above Association will be held at the Cannon Street Hotel, London, on Wednesday, June 12, when the election of president, vice-presidents, officers and committee will take place. Also the passing of the rules and constitution and other important business will be considered. Those wishing to join

the above or attend the meeting should communicate with the hon. secretary, Mr. William Borrowdale, New Durham Road, Sunderland, who will forward tickets of admission.—Yours faithfully,

WILLIAM BORROWDALE.

TRADE NOTES.

MESSRS. PINCHIN, JOHNSON & Co., LTD., of 23 to 25 Billiter Street, E.C., inform us that they have just signed the lease for their new premises, which are situated at 26 and 27 Bevis Marks, London, E.C., and that the name of the buildings will be Minerva House.

MESSRS. ROBERT BOYLE & SON, ventilating engineers, London and Glasgow, have supplied a number of their latest patent "air-pump" ventilators for the new White Star liner *Adriatic*, the largest vessel afloat.

New premises for the Wilts and Dorset Bank are being erected at Bridgwater. The materials being used are granite facings up to the sill level and Doulting stone from the Chelynch beds of the Ham Hill and Doulting Stone Company, Ltd. The architect is Mr. G. M. Silley, of London, and the contractor Mr. Pollard, of Bridgwater.

A PAMPHLET has been issued by the Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), on the preparation of concrete roofs for asphalte. The notes are intended to prevent the mistakes which sometimes occur, and directions are given concerning falls, gutters, chases, kerbs, &c. A similar booklet will soon be issued on the application of asphalte to damp-courses and building below ground. The directions are easily understood.

MESSRS. FARNHAM, LTD., have just completed cleaning by sand-blast the entrance to the Holborn Viaduct Hotel for Messrs. Spiers & Pond. This piece of work is particularly interesting, as it shows the excellent result of the sand-blast dry system of cleaning. The Portland stone-work, although much time-stained during the forty years which the building has stood, has been absolutely restored to its original colour, not only on the plain surfaces, but on the fine carved work and statuary. An inspection of this building will be interesting to architects, as it shows that it is possible to restore effectively the original brightness of the stone.

NEW CATALOGUES.

THE mere fact that Messrs. E. F. Blakeley & Co. have erected big workshops for Armstrong, Whitworth & Co., Hadfield Steel Foundry Company, Vickers, Sons & Maxim, and other workers in steel is a test of excellence which the initiated will at once recognise. They have demonstrated the absurdity of the prejudice which many people have accepted as if it were an infallible truth, that Americans alone are able to construct buildings with extraordinary expedition. The numerous examples, from churches and mission halls to shipbuilding and engineering shops, are enough to suggest the facilities possessed by the firm for executing all kinds of structures. They are even able to organise so well that many stores, bungalows and sheds have been sent from Liverpool for erection by natives on the West Coast of Africa.

THE Trussed Concrete Steel Company, Ltd., have issued a pamphlet on reinforced concrete, especially in connection with the Kahn trussed bar. The illustrations of buildings in which the system has been employed are numerous. Among them are the new Scottish Provident building, the City Chambers, Leeds; Messrs. Hudson, Scott & Son's factory at Carlisle and Whitbread's brewery. As to the American buildings, they are in legions, some of them being the largest yet constructed. The company have erected not merely buildings of many sorts, but viaducts, arched bridges, retaining walls and storage tanks. Although there are obstacles at present to the general adoption of reinforced concrete, the list of works in this country in which the Kahn system is utilised is remarkable. The description of the methods employed is explicit.

THE contractors for the new Admiralty block of buildings are Messrs. Mowlem & Sons. The foundations will cost 30,000*l.*, and the building, which is to be of Portland stone, about 100,000*l.* The architect is Sir Aston Webb, R.A. The foundations were finished some time back, and the work on the superstructure will be shortly commenced.

VARIETIES.

THE applications for new "linings" brought before Glasgow Dean of Guild Court on the 30th ult. represented a total sum of 41,308*l.*, made up of small works.

A CORNER plot of land situated at the junction of Fifth Avenue and Thirty-eighth Street, New York, measuring 25 feet by 100 feet, has just been sold for the record sum of 700,000 dols.

AN institute is to be erected in connection with Christ Church, Gosport, at a cost of 2,000*l.* It will consist of a two-storeyed building containing a library and reading-room.

THE Hull Corporation have approved of the plans and estimates of the abattoirs, and will apply to the Local Government Board to borrow the sum of 44,556*l.* The local butchers have declared that if an abattoir is built they will not use it.

THE consent of the Local Government Board has been received by the Norwich Town Council for a loan of about 50,000*l.* for the new sewage disposal works at Whittingham farm, and the necessary pumping plant at Trowse station.

FROM a Parliamentary White Paper issued giving an account of the fee fund of the House of Lords during the year ended March 31 last, it appears that the fees received on private Bills during the twelve months amounted to 26,267*l.* 7*s.* 6*d.*, and on judicial proceedings 1,659*l.* 8*s.*

THE City Board of Guardians have received the plans of the new workhouse and infirmary to be erected at Homerton, previous to their being submitted to the Local Government Board for approval. The estimated cost for the main scheme is 67,691*l.*

A MEETING of ironmongers and their assistants was held last week in the municipal technical school, Suffolk Street, Birmingham, when it was unanimously decided to establish a class for ironmongers' assistants in connection with the school. The course will include instruction in arithmetic, metallurgy, drawing and workshop practice.

THE Local Government Board inquiry into the proposals of the Newport Corporation to borrow 26,000*l.* for a higher elementary school at Stow Hill, and 20,000*l.* (in addition to

the sum of 20,000*l.* already authorised) for the erection of a technical institute, before Mr. R. H. Hooper, M.I.C.E., and Mr. T. J. Williams at Newport, has terminated.

PUBLIC works are being put down at Wishaw for the manufacture of seamless tubes on the Inshaw process. Already eight or ten acres of ground have been marked off, and the company have the option of extending the area to twenty acres. Some hundreds of men are expected to be employed in the new industry.

THE Burnley Town Council have decided, after an elaborate series of engineering reports and consideration of various suggested sites for new waterworks, to adopt the Hurstwood Valley site. It is proposed to construct a reservoir to hold 325,000,000 gallons, and Mr. Diggle, of Westminster and Heywood, the consulting engineer, estimates the cost at about 170,000*l.*

At the last meeting of the Stourbridge Board of Guardians the building committee presented a report respecting the cost of the new workhouse. The total expenditure was 102,427*l.* The loans amounted to 115,403*l.*, showing an unexpended balance of 12,975*l.* After providing for every possible contingency there would be a clear saving effected of 10,000*l.* on the loans.

A DAY SCHOOL is to be erected at Leek in connection with the Congregational church. The new school will take the place of an existing one in Union Street, and will have accommodation for 200 girls and 100 infants. The architect for the work is Mr. Reginald T. Longden, of Burslem and Leek, who is also the architect for the new Congregational church and schools at Wolstanton, Stoke-on-Trent.

For the first quarter of this year the official return shows that 293 strikes took place in Germany. The building trade was responsible for sixty-three of these, and the metal and textile industries for twenty-two each. The return shows that seventy-eight were successful, eighty compromised, and 135 failed. In regard to the lock-outs (twenty-four), ten failed, eight were successful and six were compromised.

At a meeting of the Aberdeen Town Council it was reported that the alterations carried out on the town house last year had cost 5,205*l.* Objection was taken to a proposal to give Mr. Rust, city architect, an honorarium of 250*l.*—in addition to his fee—for his services in connection with various plans prepared by him previous to a design being selected. The recommendation to give the honorarium was adopted by twenty-two votes to three.

THE last work in connection with the rebuilding of Crewe railway station was finished on Saturday, when the electrical plant in connection with the signalling was switched on. Crewe Station, which is now one of the largest in the world, has cost nearly a million pounds, and has been in course of erection twelve years. Almost everything is worked electrically.

THE contracts for the raising of the Assouan dam have been signed by the Egyptian Government. Although the level of the water will be raised by 23 feet, only very few of the sluices require alteration. The four existing locks will be rearranged, two new gates 72 feet deep supplied and a fifth lock added to the north of the present four. The contract for these alterations has been placed with Ransomes & Rapier, Ltd., who executed the original contract.

THE West Riding education committee have decided that new elementary schools are to be erected at Bentley-with-Arksey, near Doncaster, for 150 children, at an estimated cost of 1,800*l.*; Aughton (Aston-cum-Aughton), for 120 children, estimated cost, 1,440*l.*; Great Houghton, for 240 children, estimated cost 2,880*l.*; South Hiendley, for 150 children, estimated cost 1,800*l.*; and Thrybergh, for 360 children, estimated cost 4,320*l.* At Featherstone 11,845 square yards of land have been purchased for 500*l.* for a new school, and at Knottingley 6,618 square yards for 650*l.* for a similar purpose.

No. 141.

W. & T. AVERY, Ltd., Soho Foundry, BIRMINGHAM.

To complete the new waterworks at Masham and the drainage and sewage-disposal works for the town, the Harrogate Corporation applied last week to the Local Government Board for sanction to a loan of 100,000*l.* for the waterworks and 36,500*l.* for the drainage scheme. Mr. E. W. Dixon, the engineer, said the excess in the estimate for the waterworks was due to circumstances over which they had no control. He denied that any new machinery had been thrown on the scrap heap.

A SPECIAL meeting of the Cardiff Mental Hospital visiting committee was held on Thursday to consider tenders for furnishing the asylum. The Local Government Board wrote stating that they could not sanction the loan of 25,000*l.* for furnishing until they had full details of the tenders accepted by the Council. The sub-committee recommended that 4,000*l.* be set aside for the farm buildings, 1,000*l.* for the piggeries, 1,000*l.* for stabling, and 2,000*l.* for the sheds for thirty cows, motor-house, &c.

At a meeting held in Glasgow last week in the office of Messrs. Ramsay & MacLeod, writers, it was unanimously resolved to form an Employers' Council, consisting of three representatives from each of the associations in Glasgow connected with the building trade, the objects of the Council being to secure united action in dealing with all matters affecting the interests of any section of the building trade. Mr. William Nicol was appointed president, and Mr. J. D. Ramsay, writer, secretary.

THE electricity committee of the Manchester Corporation have decided to ask the Council to take the necessary steps for borrowing a further sum of 112,850*l.* to meet the cost of new works during the next three years. Mr. Pearce, chief engineer, estimates that 3,250*l.* will be needed for super-heaters and other things at the Stuart Street station, 6,300*l.* for new mains, 32,000*l.* for transforming plant and switch-gear for supplying large consumers, and 14,600*l.* for additional plant at the Corporation sub-stations.

THE annual report of the medical officer for Dudley records a lower death rate than in any other year on record, and states:—The lessening of mortality in the borough had been brought about by improvement in housing and sanitary conditions. That the housing of the labouring classes had undergone great change for the better must be evident,

it is said, to anyone who made careful observation of the number of new streets, houses erected on the outskirts of the town, and the condition to-day of the slum properties in the central parts of the borough. There yet remained an enormous amount to be done before the housing could be considered entirely satisfactory, but this work was being well and thoroughly done.

THE ceremony of laying the record-stones at the Howden and Derwent reservoir of the Derwent Valley Waterworks will be performed on the 21st inst. The records will be built in the face of the dams, at about 40 feet above the level of the old river bed. The works in progress at each reservoir will be examined, and the record-stone in each dam will then be laid. It is proposed to have a short and simple ceremony in which the Bishops of Southwell and of Sheffield will take part. The temporary village for the workmen, with its population of about 900, will also, it is likely, be visited.

THE general purposes committee of Wednesbury Town Council recommend that application be made for sanction to a loan of 8,000*l.*, with a view to plant being laid down for the generation of electric current, which hitherto has been supplied in bulk to the Corporation by the Midland Power Company. The outlay for erecting new works and providing engines and other plant is estimated at 7,860*l.*, and the scheme will, it is stated, enable the mains to be extended to the King's Hill district, for which purpose it is proposed to carry the wires overhead on the tramway poles.

THE site of the Urban Housing and Rural Home-steads Exhibition, which is to be opened in July at Letchworth, now presents a field of great activity. Three sites of ground have been set apart at Letchworth for the exhibition—two for the creation of rural homesteads and small holdings buildings, and one near Letchworth station for urban cottages ranging in cost from 175*l.* to 250*l.* There will probably be some fifty houses erected of at least thirty different types. The exhibition is much more comprehensive in its scope than was the 1905 Cheap Cottages Exhibition, and, besides comprising cottages of a higher value and wider range than before, an exhibition of manufacturing implements, builders' merchants' materials, temporary buildings, &c.

THE water committee of Aberdeen Town Council, who have before them the question of a new or additional water supply for the city, have resolved to obtain additional expert advice on the matter, and will ask Sir Alexander R. Binnie, Mr. Strahan, and Dr. Houston, the well-known bacteriologist, to furnish them with a report on the subject.

In view of the success attending the Garden City at Letchworth, Herts, a scheme is on foot for the establishment of a garden suburb at Upminster, Essex. A special feature will be the placing of shops and business premises in one particular corner of the estate, and the allocation of the remaining area to commodious detached and semi-detached residences of two or three storeys. Only four houses are being built to the acre, the frontage in each case varying from 40 feet to 80 feet, and the garden being between 250 and 300 feet in depth. The prices, for leaseholds range from about 395*l.* to 835*l.*, and moderate ground rents with freedom from tithe and land tax are asked. The prices for freeholds range from 595*l.* to 1,035*l.*

At a meeting of combined committees interested in the development of the Caledonian Canal, held in the council chamber, Inverness, it was reported on behalf of the executive that they had carefully considered the question in all its aspects and had resolved to submit the scheme provisionally arrived at by them. The leading features of it are that the approaches to the canal at both ends be improved, that the canal be deepened throughout to 26 feet, that the locks be enlarged to 600 feet long by 80 feet wide, and that Loch Oich be lowered to the level of Loch Lochy. It was agreed that Mr. D. J. Reid, C.E., Inverness, be asked to survey the ground and prepare technical and engineering information, including an estimate of the probable cost of giving effect to the committee's recommendations. It was also agreed that an engineer of first rank be engaged to support the case as prepared by Mr. Reid.

THE scheme for the additional water-supply for Kidderminster and district has now been completed, and the contractors have handed over to the Corporation the whole of the new pumping works. Messrs. Wilcox & Raikes, of Birmingham, have been the consulting engineers, and Messrs. T. Vale & Co., of Stourport, the contractors. The cost of the works has been something like 20,000*l.* It

is claimed that by the new scheme the entire district can be supplied with water at a much less cost in working expenses than by the old duplicated system, which will now be held in reserve. The new well, while not yielding as much water as was originally estimated, will yield twice as much as the district at present requires, and the engines will only be worked during the day instead, as formerly, pumping a continuous service into the reservoirs.

At the town hall, Bridlington, Mr. H. Shelford Bidwell, M.I.C.E., inquired recently on behalf of the Local Government Board into the application of the Town Council for sanction to borrow two sums—3,547*l.* and 555*l.*—for extra work in connection with the erection of the new sea wall and the Victoria Terrace footpath, immediately to the north of the Royal Prince's Parade. It was shown that the extra cost was incurred largely through springs in the foundations; drainage having to be provided along over half a mile of wall. The town clerk said the wall had been completed in October, 1906, and the Council deferred borrowing the money for which sanction was now sought, in the hope that the Local Government Board would extend the period for repayment of the whole capital expenditure of over 20,000*l.* from twenty-five years to fifty years, contending that for such a permanent structure, likely to last over a century, fifty years at least ought to have been granted. The Council hoped also that the Coast Erosion Commission would support an extension of time for the repayment of such heavy expenditure.

AN INDIAN BOND FOR BRICKWORK.

The majority of engineers and some builders frequently leave the question of bond in brickwork to the unhampered choice of the working mason. Such casual proceeding, says *Indian Engineering*, is seldom attended with any serious risk in case of walls whose thickness is the length of a single brick, for here the bricklayer will be pretty certain to adopt either the Flemish or the English bond, both of which are unobjectionable in the majority of cases, though the latter is distinctly the sounder arrangement. When, however, as is the case in the majority of works which engage an engineer's attention, the thickness much

exceeds that of a single brick, consequences of such neglect in detail are frequently deplorable. We have seen large masses of brickwork—notably in lock walls—consisting of nothing but headers, if we except those stretchers which appear on the exposed face of the wall and which of course occupy but a minute fraction of the wall's cross section. Such a structure, if we ignore the adhesion of the mortar, has but little more longitudinal strength than has a huge faggot of short sticks without that string which is usually provided by the woodcutter.

It is scarcely surprising therefore that the majority of such walls develop transverse cracks, even when they are exposed to nothing more in the way of bending moment than is incidental to ordinarily careless construction.

The main desiderata of a good bond are three:—(1) The bricks should overlap in each direction an aggregate extent which is approximately proportional to the bending moment or shearing stress to which the wall may be exposed in that plane; (2) the bond should not necessitate the cutting of bricks; (3) it should be applicable to walls of all thicknesses and yet sufficiently simple to be easily learnt by the ordinary bricklayer. The "Habri" bond pre-eminently satisfies all these requirements; the first two demonstrably, and, concerning the last, we have never met a mason who did not readily comprehend the system as soon as it had been illustrated in his presence by the piling of a few dry bricks.

In the Habri bond every course, in a wall of indefinite thickness, is essentially identical with every other course, and consists of a cycle of three rows of bricks—two rows of stretchers followed by one row of headers. This arrangement in each course is, however, shifted half a brick in a direction at right angles to the rows, as compared with the course upon which it rests, the direction of the shift remaining constant throughout the wall's height. When, under the above clause of this rule, a row of headers would be divided by the plane of a face of the wall, a row of half bricks is *not* inserted, but a row of stretchers substituted.

In the case of a wall half a brick thick this bond necessarily reduces—as do all other bonds—to a wall consisting of stretchers only. When the wall is one brick thick we have one course of headers only, followed by three courses of stretchers only; the arrangement being here identical

with common English bond, which is undoubtedly the soundest arrangement in a one-brick wall under ordinary circumstances.

It is, however, in walls exceeding one brick in thickness that the value of our systematic rule becomes evident. Starting from the face an arch abutment of indefinite thickness would have in its first course one row of headers followed by two rows of stretchers, and so on. The second course would show one row of stretchers followed by one row of headers and then two rows of stretchers, the last three rows being repeated indefinitely. The third course would consist of two rows of stretchers followed by one row of headers, and so on. The fourth course would have three rows of stretchers next the face followed by the usual cycle of one row of headers and two rows of stretchers. This completes the cycle of courses, the fifth course being identical with the first not only in arrangement, but also in horizontal position. In the case of a wall under a vertical load, the direction in which the half-brick step by which each course has its arrangement shifted as compared with that of its predecessor is made has no importance, though of course it should remain unaltered throughout the wall. When, however, the wall is exposed to an inclined thrust it is preferable to make the shifts as you ascend in the same direction as the thrust. Thus in an arch abutment the shifts are made from the face; in a revetment wall towards it.

The name Habri is that of a distributary channel upon which the bond was first employed some twenty years ago.

REINFORCED CONCRETE.

THE last report of the committee on architecture, Illinois Society of Engineers and Surveyors, contains the following advice on the use of reinforced concrete:—

Your committee on architecture considers it advisable to devote its annual report chiefly to reinforced concrete, on account of its increasing use for structural purposes in engineering and architecture.

This material is now regarded by the public generally as a panacea for all the difficulties and errors frequently made in construction, and also as cheaper and more

economical than any system of equally substantial and durable construction. But certain precautions must be observed, or very serious accidents are certain to result from its use by inexperienced or careless men, especially by the "skin" contractor, and it may be well to mention some of the probable sources of trouble.

1. *Quality of Materials.*

When subject to inspection by competent superintendents, the cement will usually be fresh and of a reliable brand, the sand and aggregate will be free from clay and dirt, due proportions be used, and the method of mixing and tamping be reasonably efficient and uniform. Then the resulting structure can reasonably be expected to have the computed strength, which will increase for an unknown time, perhaps continually.

But many contractors prefer to believe that an addition of lime paste strengthens Portland cement, and if this were true more paste would make it still stronger, attaining a maximum strength without any cement at all. Of course, the setting is delayed, but this is of less consequence in walls, where most of the contractor's experience has been gained. Owners of proposed structures know very little concerning the relative strengths of various brands of cement, and they are likely to consent to the substitution of an inferior grade, if the contractor offers a small discount on the cost of the work.

The aggregate also varies considerably, as crushed soft sandstone is sometimes supplied instead of hard limestone or granite. The contractor is also inclined to suggest coal cinders as much cheaper and just as good, while cinder concrete is entirely unfit for structural members, being only suitable for use as a mere filling.

2. *Workmanship.*

The wooden forms require to be true and to retain their shapes without deflection or bulging when the concrete is tamped in place. Concrete should always be mixed in a suitable machine, for the hand process is very uncertain, even when done under careful supervision. It must be tamped carefully and uniformly without displacing any part of the steel reinforcement, and this work must be done by experienced men, not by common labourers employed by chance.

3. *Setting.*

Since the wooden moulds are expensive and the owner desires the completion of the building at the earliest moment possible, there is always a temptation to remove the moulds too quickly in order to use them for a higher part of the structure. This should never be done, for it probably causes most of the serious accidents and sometimes the destruction of buildings, as frequently reported in the newspapers. Cracks are also likely to occur in the exposed surfaces of beams and floor-slabs, thus seriously weakening those members.

4. *Protection from Concentrated Loads.*

During the construction of a building the materials for the upper storeys or the roof are frequently piled up in masses on the floors already built. This is perhaps safe while the forms are in place, since these are usually strongly shored and supported. But after these are removed, such concentrated loads generally cause a permanent deflection and may rupture the floor. The average labourer or mechanic regards a floor as similar to a solid ledge of natural rock, perfectly able to support any load that may be piled on it. Here, then, is a great risk to concrete structures unless very carefully superintended.

5. *Use of Steel Columns Enclosed in Concrete.*

Although buildings consisting of several storeys have been successfully built, in which the supporting piers or columns are of concrete reinforced by steel rods and bonds only sufficient to prevent bending out of verticality it is evident that for higher structures, or those exposed to heavy floor loads, the column loads should be borne by a steel column to which the floor beams are properly connected, and not be supported merely by a stiffened concrete pier. This is especially true in case the piers are exposed to side pressures or jolts or moving loads are carried on the floors.

6. *Fireproof Interiors.*

Interiors should be made fireproof. Reinforced concrete is merely incombustible, not fireproof, like terra-cotta or bricks. It is calcined to a considerable depth by exposure to great heat and is liable to be washed off by a stream of water, possibly exposing the steel to heat and certainly

requiring extensive repairs. Therefore, as careful precautions should be taken as in case of a steel frame fireproofed building to avoid wood finish, wooden partitions, wooden furniture and accumulations of books and papers, which would supply materials for destructive fire. Wire-glass, metal sash and metal-covered doors would also be excellent.

It is probable that these precautions are often impossible, and that a chief reliance must be placed on prompt extinguishment of any local fire before it has time to spread through the building.

7. Precautions against Frost.

Construction should not continue during freezing weather, and all completed work not fully set should be thoroughly protected from frost. The average contractor usually argues that a "frozen set" for plastering or mortar is even better than one without freezing. But this is certainly doubtful, unproven and to be avoided always. His argument merely tends to extend the season for his building operations, and is therefore open to suspicion, especially since the experience of every architect reminds him of serious damages to his buildings by frost. Freezing certainly is likely to make the concrete less compact, cause cracks and retard setting. The use of salt, hot water, heated sand and aggregate are merely palliatives to soothe the conscience of the superintendent. This danger will be most likely to occur in northern cities, where the building season is too short for the amount of work to be done, and owners and contractors are willing to take almost any risk in order to complete the building and make it produce revenue at the earliest date.

These suggested dangers in the use of reinforced concrete show, in my opinion, that the use of this material should only be permitted under the direct supervision of a competent engineer or architect, and never be left to the mercies of an inexperienced contractor, who sometimes regards a structure as safe if it does not fall before his pay is received. Yet the chief danger would come from a failure to observe all of the preceding precautions rather than through dishonesty in materials or workmanship.

With proper care in execution this material is certain to be widely employed for many kinds of structures, will be

reasonably resistant to fire, and its strength will increase for a long time. It will doubtless take the place of wood construction for all the more important or expensive buildings, except tall fireproof office buildings and department stores. For these the loss of time in erection and the loss of rental would more than exhaust any saving in the cost of construction, not to mention the probable higher rate of insurance on the building and its contents.

In computing the safe strength of any proposed reinforced-concrete structure, the designer should be very conservative in applying formulas and data based on experiments made at testing-stations, where all precautions are observed and the work is done by experts in a manner far superior to that possible in actual structures.

Reinforced concrete was invented in 1868 in France by Joseph Monier, a gardener, being first utilised by him in building a greenhouse. Its use extended very slowly, so that the material has been largely employed in France and Germany only during the past fifteen years for all classes of buildings, even for those of monumental character, covered by large domes and vaults. Few accidents have occurred, as the properties of the material have been carefully determined by experiments made by the most famous investigators in Germany and France, and the governments have made and strictly enforced stringent rules for the execution of the work. *Béton und Eisen*, a monthly journal of the most scientific character, contains numerous examples of recent structures, calculations of their safe strength and discussions of all matters of interest.

To indicate the very careful regulations for reinforced-concrete construction, it may be of interest to quote a few points from the general order issued by the Prussian Minister of Public Works in 1904:—

"Complete drawings, calculations and specifications must be submitted in order to obtain a permit to build.

"Only Portland cement of the Prussian standard is allowed.

"Sample blocks must be tested.

"No concrete to be made in freezing weather, and concrete must be protected from frost.

"Side planks may be removed after three days, other forms and supports only after fourteen days.

"Structures must be approved by State building officials."

"Rules, formulas and data are given which must be employed in computing the safe strength of floor-slabs, beams and columns of reinforced concrete."

A Prussian building ordinance is made to be obeyed strictly, not suspended at the request of an alderman or the order of a city council. It is evident that it would be almost impossible for a dangerous accident to occur in Prussia, and at this new material may safely be used there. There could be a State building law in Illinois requiring the minimum precautions necessary for safe building. Until such a law exists and is enforced reinforced-concrete construction should be executed only by competent engineers and architects. If left to the ordinary contractor serious accidents will certainly occur, casting undeserved odium on a very useful and promising method of construction.

Mr. F. Oswald, of this committee, reports that he has completed the Madison county almshouse, consisting of concrete basement and two storeys of brick; floors, steel beams and reinforced concrete, iron stairs, the latter item increasing the cost of wooden stairs about 40 per cent. The floors are finished with a 3/4-inch coat of Portland cement and crushed granite screenings, half-and-half, excluding the use of wooden floor for sanitary reasons and fire protection. The dormitories floor for sanitary reasons and fire protection. The dormitories floor will be covered with heavy linoleum or matting.

AMERICAN TIMBER TRADE.

It is reported that the timber trade of the Portland district was the largest last year on record and was generally profitable. Logs advanced steadily, the average advance during 1906 being 50 per cent. Sawn timber advanced in proportion and prices at the close of 1906 were 17 per cent higher than at the beginning. There was an unusual demand caused by the earthquakes in San Francisco and Chile. Mills in the interior, however, had great difficulty in making deliveries, as the railroads had not sufficient rolling-stock to carry the traffic. The result has been a heavy loss to such mills and demoralisation of their trade.

The reported cut of the saw mills for the year is given in the trade journals as 2,000,000,000 feet in Oregon and 1,250,000,000 feet in Washington. These figures are prob-

ably exaggerated, and are given only as an indication of the immense volume of the industry. The district contains the largest saw mills in the world, and Portland is the largest lumber producing city, its mills having cut 643,532,893 feet, of which one mill alone cut 146,000,000 feet and two others over 100,000,000 feet each. Grays Harbour mills, Washington, cut 545,235,221 feet and Tacoma mills 396,700,000 feet, of which one mill cut 130,000,000 feet. There are 577 mills in Oregon, 841 mills in Washington and 260 mills in Idaho, employing in the aggregate 39,382 men, not including those employed in logging operations. Numerous additions were made to the number of mills during the year. A new one built at Potlatch, Idaho, is said to be the largest in the world, and can cut 750,000 feet daily.

The lumber output in Astoria was hampered at the end of the year by deficient railway transport. Labour was so well remunerated that, although the town is surrounded by forests, there was an actual scarcity of fuel, as men could not be found to cut wood and bring it in. There is little timberland now in the hands of the United States Government in this district. It has almost all been taken up by selectors, and through them bought up by syndicates controlling large areas, who hold it for future use or sale. Logging has developed wonderfully during 1906. Timber near the streams has long since been logged off, and numerous small logging railroads have been built into the forest to bring out the logs, which has stimulated the industry. The price of logs has advanced to 27. 8s. per 1,000 feet for the best. The output of the saw mills has increased by a large percentage in the district, the cut of the lower Columbia River mills being 125,000,000 feet; of Grays Harbour and Willapa Harbour 600,000,000 feet; and that of the mills on Tillamook Bay 14,000,000 feet; making 739,000,000 feet. This amount of lumber is at the lowest calculation worth 1,920,000l., a very great amount when the smallness of the population is taken into account. The tendency is to increase the cut. Of this output the largest part goes to California by sea, a good proportion to the States east of the Rocky Mountains and the rest to foreign ports.

Puget Sound exported 37,525,000 feet of timber in excess of 1905. There has been great activity in the business, and

THE "SICNET" Combined Range and Sitting - Room Grate.

Very suitable for Small Houses, Country
Cottages, Flats, &c. (Patented.)

Combines in itself in a practical and efficient manner the essential features of a Cooking Range and Sitting-room Grate.

Many of these Grates are in use at Letchworth and Cleveleys Garden Cities and elsewhere. Harmonises with artistic surroundings and looks well in any room. Size 38x38 inches.

Supplied when desired with High-Pressure Boiler, also with artistic Cast-iron Chimney-piece. Goes into an ordinary fireplace like a Register, very little building being required. Well fitted and finished.

Has been THOROUGHLY TESTED and has given UNIVERSAL SATISFACTION. This Grate can only be supplied through Builders' Merchants, Iron-mongers, &c. Copies of unsolicited testimonials and further particulars may be had from the Makers,

the coasting trade, on account of the San Francisco disaster, has been very great. The demand at interior points, by railway, has also been heavier than in any previous year. Mills are running day and night and are unable to cope with the demand, being far behind on orders. New industries established in Pierce county during last year were chiefly engaged in the manufacture of timber. The timber in Western Washington is principally Douglas fir, red cedar, hemlock and spruce. The county of Pierce is estimated to have 602,907 acres of timber land, of which about 22,384 acres have been logged off. There are thirty-one saw mills and fourteen shingle mills in this county, with a daily capacity for manufacturing 2,000,000 feet of timber and about 1,000,000 feet shingles. It is reported that the total shipments of timber from Tacoma during the year amounted to over 141,000,000 feet, the average value being 2½. 10s. per 1,000 feet.

THE PEARSON CASE.

JUDGMENT was given in the House of Lords last week by the Lord Chancellor, Lords Halsbury, Macnaghten, James, Ashbourne, Atkinson and Collins in the appeal by Messrs. Pearson & Son, Ltd., v. the Lord Mayor and Corporation of Dublin. The action was brought by the appellants to recover from the respondents two sums of 11,907£. and 36,374£. and costs in respect of main drainage works for the city of Dublin, executed by the appellants for the respondents, but the 11,907£. has since been paid. In connection with the construction of the outfall works at Pigeon House harbour, it was intended to utilise as far as practicable an existing north harbour wall on the Liffey side of the harbour, and for that purpose and for preventing the escape of sewage matter to construct a concrete lining to the inner surface of the wall, the thickness of the concrete to be determined by the exact profile of the wall when exposed by excavation. The appellants claimed 36,374£. for work and labour done and materials supplied by them at the request of the respondents in completing the work, the subject of the contract, for extra expenses in connection therewith, in addition to the works included in the contract. The appellants also claimed damages for alleged false re-

presentation in regard to the North Harbour Wall. The respondents denied the alleged fraudulent misrepresentations and denied that the appellants suffered damage by reason of them. The action came before the Lord Chief Baron and a special jury, and a verdict was entered for the respondents. The appellants asked that the verdict and judgment should be set aside and a new trial ordered. The King's Bench ordered that the verdict and judgment should be set aside so far as related to the cause of action for fraud and a new trial on the question was ordered. The Court of Appeal, however, reversed this decision. The respondents contended that there was no evidence that the representation as to the character of the dock wall was false to their knowledge. The Corporation throughout the entire specification disclaimed any knowledge of the actual state of things existing at the time of the contract.

The Lord Chancellor, according to the *Irish Times*, in giving judgment, said:—This is an action for deceit brought by Messrs. Pearson & Sons, contractors, against the Dublin Corporation. Inasmuch as I am about to propose that the case be remitted for a new trial, it is desirable that I should say no more than is necessary to explain my view. The plaintiffs' case is that they were induced to enter into a contract for the construction of certain sewage works by statements made by and on behalf of the defendants as to the existence to a depth of 9 feet below ordnance datum of an old wall. Undoubtedly evidence was adduced at the trial from which the jury might, if they thought right, conclude that the plaintiffs were so induced by statements made on behalf of the defendants. Also there was evidence for the jury that those statements were made either with a knowledge of their falsity, or which is the same thing, with a reckless indifference whether they were true or false on the part of the engineers employed by the defendants to make the plans, which were submitted to plaintiffs as a basis of the tender, and had the case rested there, I gather that the Lord Chief Baron would have left the case to the jury, and that the learned judges who subsequently had this litigation before them would have approved this course. But another feature of the case was considered fatal to the plaintiffs' claim. The contract contained clauses which need not cite at length, to the effect that the contractors not must rely on any representation made in plans or else-

here, but must ascertain and judge of the facts for themselves, and therefore the Lord Chief Baron withdrew the case from the jury. As I understand it, the view he held, substance confirmed by the Court of Appeal, was that the plaintiffs so forewarned had no right to rely on any representation and could not be heard to say they were induced to act on statements on which by contract they were not to rely; or, at all events, it was said that the defendants being themselves innocent, are protected by such clauses against the consequence of contractors acting in false statements made by defendants' agents, however fraudulent those agents might be. Now, it seems clear that no one can escape liability for his own fraudulent statements by inserting in a contract a clause that the other party shall not rely upon them. I will not say that a man himself innocent may not under any circumstances, however peculiar, guard himself by apt and express clauses from liability for the fraud of his own agents. It suffices to say that in my opinion the clauses before us do not admit of such a construction. They contemplate honesty on both sides, and protect only against honest mistakes. Serjeant O'Connor and Mr. Ronan, in their able arguments, and the arguments on both sides have been very able, make a further point. They say that though the principal is liable for the fraudulent representation of his agent, yet that rule only applies where the representation is in fact been made by the agent. I cannot accept that contention. The principal and the agent are one, and it does not signify which of them made the incriminated statement or which of them possessed the guilty knowledge. It is not necessary to say anything as to the Public Authorities Protection Act, for the Court of Appeal held that it did not apply to this case, and I am entirely of the same opinion. I respectfully recommend to your lordships that this case be sent for a new trial, and that the respondents pay the costs of this appeal and the costs in the King's Bench Division and the Court of Appeal, the costs of the first trial to abide the event.

Lord Ashburne: I concur in the opinion of the Lord Chancellor that the appeal should be allowed, and as that involves the grant of a new trial, I shall say as little as possible upon the merits of the case. With the highest deference for the opinions of the Lord Chief Baron and the

learned Judges of the Court of Appeal in Ireland, I am of opinion that the case should not have been withdrawn from the jury. I think that there was evidence given at the trial upon which a jury might reasonably, if they thought proper, act in finding that the plaintiffs had suffered serious damage in consequence of the acts of the defendants or of their agents. The evidence went to indicate—(1) that the plaintiffs were influenced in making the contract referred to in the case by statements for which the defendants were liable as to the existence of an old wall in an important position to the depth of 9 feet; and (2) that those statements so made were false in fact, and were made by the engineers of the defendants recklessly, and without any real belief in the existence of the facts represented. It may be inferred from the evidence of Mr. Hellins that the false representations were of the highest importance, were calculated to deceive and were intended to be acted on. But the decisions of the Lord Chief Baron and of the learned Judges in the Court of Appeal were not founded upon the opinion that there was no evidence fit to be submitted to the jury. They rested mainly upon the construction of the contract, whose 43rd clause provided that the contractors must not rely on any representation made in the plans, but must ascertain and judge of the facts themselves. The Lord Chief Baron laid it down that the contractor was "not entitled in point of law to say he acted to the extent of a hair's breadth upon the statement contained in the plans." I am entirely unable to concur in this view, and with much deference to the opinions of the Lord Chief Baron and the learned Judges of the Court of Appeal, I cannot conceive how, in face of the evidence in the case, this clause 43 could be regarded as establishing a defence. Such a clause might in some cases be part of a fraud, and might advance and disguise a fraud, and I cannot think that on the facts and circumstances of this case it can have such a wide and perilous application as was contended for. Such a clause may be appropriate and fairly apply to errors, inaccuracies and mistakes, but not to cases like the present. The respondents' counsel argued their case with great acuteness, but they could not overcome the broad contentions they had to face that there was evidence for the jury, and nothing in the contract to prevent the jury fully considering that evidence. I think the order suggested by the Lord Chancellor is correct.

OETZMANN & CO. LTD.

HAMPSTEAD ROAD, W.
Continuation North of Tottenham Court Road

Lord Atkinson, in the course of his judgment, said :— As I understand the argument addressed to your lordships by the counsel for the defendants they rested their case on grounds totally different from those on which the decision of the Court of Appeal was based. They did not rely upon the distinction between conscious and unconscious fraud at all, but contended that on a true construction of the contract, incorporating as it does the plans and specifications, it was plain that the only representations made to the plaintiffs were made by the defendants themselves, not by their engineers; that it was admitted they themselves gave to the plaintiffs such information as they had; that they did so innocently, believing it to be true; that they did not warrant this information to be accurate; that they were, therefore, not responsible for the fraud of their engineers, if fraud there was; and that it was perfectly legitimate for them to protect themselves, as they contended they had protected themselves, by this article 43, and the other articles referred to; and that they were, therefore, in point of law entitled to the direction their counsel had asked for and obtained. I do not think that this contention is sound. On the whole, I am of the opinion that the decision of the Court of Appeal in Ireland was wrong and should be reversed.

Lord Halsbury, Lord Macnaghten, Lord James and Lord Collins concurred.

As the result of a discussion on the question of costs, it was finally decided that the order appealed from should be reversed, and that the respondents should pay the costs of the appeal to the House of Lords and the costs in the Court of Appeal.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, Mr. J. W. Wilson, vice-president in the chair, a paper was read on "Working Experiences with Large Gas-engines," by Mr. Cecil A. St. George Moore, B.A. Camb., of which the following is an abstract :—

The author commenced by comparing the various forms of gas-engines built in Great Britain with those built on the Continent, and enumerated the various characteristics of the

different types of engine as designed by various manufacturers with regard to number and arrangement of cylinders, single and double-acting engines and other points of design. After pointing out the advantages or otherwise of positive scavenging, and which is still an open question, the author considered the various methods used for governing, and remarked that in continental practice this point had received very careful attention.

The author next dealt with the relative advantages of the two and four-stroke cycles, the Körting and the Oechelhäuser engines being taken as the most prominent examples of the former type. The author considered that the thermal and mechanical efficiencies of the Körting type of engine were lower than in the case of the four-cycle type, and he gave results of tests bearing out this conclusion.

He then gave some details of the design of the piston and cylinder of the Körting engine, and mentioned several defects in those parts which had given trouble, and described modifications in design that had been adopted to overcome those defects. After giving some details as to the actual wear of cylinders in practice, the author proceeded to discuss the question of the correct method of supporting the piston, and referred to the difficulty of keeping the rods quite straight if the piston was supported from the guides.

The next point considered was metallic packing. After noting the essential points of a satisfactory packing, the author described a form of packing that he had found to work well in practice. Reference was then made to the theory of stratification of the working mixture as applied in the Körting engine, and an account was given of some curious effects noted on changing the position of the point of ignition in the cylinder. The author then treated at some length the question of pre-ignition in large engines, and referred to some probable causes of the same.

After noticing the utilisation of the waste heat of the exhaust, the author concluded by considering the properties of producer gas and its suitability for use in large engines. He laid great stress on the necessity for thorough cleaning of the gas, and mentioned the effects of tarry gas when supplied to an engine. He arrived at the conclusion that a percentage of about 27.6 of hydrogen in producer gas was not too great for its satisfactory use in large engines.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

COMPETITIONS OPEN.

IRELAND.—July 1.—The Kingstown Urban District Council invite competitive drawings for houses for the very poor. The first premium will be 100l. and the second 20l. The selected plans to become the sole property of the Council, and no further remuneration shall be paid to the architect should the Council decide to carry out the works themselves. Particulars may be obtained on a deposit of 1s. with Mr. M. A. Manning, town clerk, Kingstown, Ireland.

IRELAND.—July 2.—The Kilkenny Corporation invite competitive designs for a Carnegie free library, to cost not more than 1,800l. All particulars from Mr. E. O'Connell, town clerk, City Hall, Kilkenny.

IRELAND.—July 20.—The County of Cork Joint Hospital Board invite competitive plans for a sanatorium for consumptives with accommodation for seventy patients. A prize of 100l. will be paid for the plans which the Board may adopt, provided that said plans are sanctioned by the Local Government Board, and said plans shall become the absolute property of the Board. Intending competitors will receive a map of the site and other information on sending P.O. for 10s. to Mr. E. J. Murphy, secretary of the County of Cork Joint Hospital Board, Court House, Cork.

NORTHENDEN.—June 17.—The Sale and Ashton-upon-Mersey education authorities invite applications, on or before June 17, from architects practising within 20 miles of Manchester desirous to enter into a limited competition for designs for a school to accommodate 400. Mr. W. Taylor, Technical School, Sale.

WEYMOUTH.—July 30.—The Weymouth Town Council invite designs for a pavilion to be erected on the north side of the pier. One hundred guineas will be awarded for the selected design, such design to become the property of the Council. Mr. H. A. Huxtable, town clerk, Municipal Offices, Weymouth.

CONTRACTS OPEN.

BECKERMET.—June 15.—For cementing and plastering two dwelling-houses at Beckermert. Mr. Walter Trippiear, joiner and builder, Beckermert, Cumberland.

BELFAST.—June 25.—For building and completing a three-storeyed building for a children's infirmary. Deposit 2l. 2s. Messrs. McCarthy & Brookes, building surveyors, Scottish Provident Buildings, Belfast.

BOSTON.—June 15.—For school coal-house to be erected at Gipsy Bridge school, near Boston, also for painting as per specification. Mr. J. H. Tooley, 6 Bridge Street, Boston, Lines.

WIGAN.—June 30.—For repairs and painting to be done at the workhouse. The Master, Union Workhouse, Frog Lane, Wigan.

WORKINGTON.—June 26.—For alterations to premises in John Street and Jane Street. Messrs. W. G. Scott & Co., architects and surveyors, Workington.

WORSBROUGH BRIDGE.—June 17.—For the erection of a house, shop and appurtenances, Park Road, Worsbrough Bridge. Mr. Arthur Whitaker, architect, Saville House, Worsbrough Bridge, near Barnsley.

A DAY SCHOOL is to be erected at Leek in connection with the Congregational church, which will have accommodation for 200 girls and 100 infants. The architect for the work is Mr. Reginald T. Longden, of Burslem and Leek, who is also the architect for the new Congregational church and schools at Wolstanton.

In St. Mary's Hall, Coventry, on the 7th inst., Mr. A. Brightmore opened on inquiry on behalf of the Local Government Board, in regard to the application of the Coventry City Council for sanction to a loan of 30,000*l.* for the erection of municipal offices in Earl Street and St. Mary Street. It was said by the representative of the Corporation to be impossible owing to the financial conditions of Coventry to seriously undertake the erection of a town hall with municipal offices which would cost from 120,000*l.* to 130,000*l.* It was hoped to get a rental of about 700*l.* to 750*l.* from ten shops which it was proposed to erect under the municipal offices. Mr. T. F. Tickner, the architect, gave details of the plans, and said his estimated cost of 26,736*l.* was arrived at by cubing, which he considered the best system. He thought the shops should readily fetch a rental of 100*l.* a year each. By Mr. Eales: If necessary, in years to come, the shops proposed could be adapted as offices. He did not consider this an ideal site for a town hall. By Mr. Maddocks: A scheme could be devised to provide the requisite office accommodation on this site, and leave the matter of a town hall itself for the future. He did not know a case of combined municipal offices and shops. A memorial, signed by 988 persons, representing 18,364*l.* rateable value, against the scheme was presented.

TENDERS.

TRADE NOTES.

As announced in a previous issue, Messrs. Pinchin Johnson & Co. have secured premises to be known as Minerva House, Bevis Marks, London, E.C., and it is their intention to take possession on June 24, so that on and after that date all communications should be sent to that address.

HOBBS, HART & Co., LTD., announce that they have refitted their lock furniture show-room at 76 Cheapside with a large and varied selection of the best and most artistic designs

for this class of work, of which an early inspection is invited.

THE Workhouse infirmary, Watford, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, patent Manchester grates and special inlet ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE "Swincam" camera stand for photographers is the most useful and adaptable stand we know of. Both professional and amateur photographers are taking it up. The patentee, Mr. William Boulter, of Southport, has designed a cheaper form of tripod, known as Model B; it is 4 feet 6 inches high, weighs 3 lbs. 9 oz., and the cost is only 1*l.* 11*s.* 6*d.* The advantage of the "Swincam" stand is the possibility of fixing in any awkward position, so that the lens can be brought to any desired angle and fixed there without resorting to the use of a swinging back or front to the camera.

NEW CATALOGUE.

ALTHOUGH the use of lifts may be occasional, and only a short time is occupied with a journey in one of them, there is no reason why, in dwelling-houses at least, they should not be made as handsome as the staircases which they have superseded to a great extent, or to which they are supplementary. The illustrations in the catalogue of lifts for private residences, issued by Messrs. R. Waygood & Co., Ltd., are evidence of a recognition of the necessity of beauty of form. The lines of the metalwork in the lifts and in the protecting grilles are in the flowing curves to which the material lends itself. The woodwork is also suitably designed, and the upholstery is luxurious. In addition the automatic push button enables the inmates to be independent of servants, for the most timid lady can ascend and descend without the least misgiving concerning her safety. The list of mansions in which the passenger lifts are introduced is evidence of the confidence which Messrs. Waygood have secured. Among their clients are the King and the Prince of Wales. The lifts are to be found in the palaces of the King of Siam and the Khedive.

KAHN SYSTEM REINFORCED CONCRETE.

USED ALL OVER THE WORLD.

We invite the closest scrutiny of the Kahn System by Architects, and seek their co-operation. Our corps of experienced engineers and draughtsmen is at the command of engineers, architects, and contractors who may wish to specify the Kahn System, and we are glad to furnish drawings for any work in which the Kahn Bar is to be used.

The TRUSSED CONCRETE STEEL CO., Ltd.

53 CAXTON HOUSE, WESTMINSTER, S.W.

AGENTS WANTED.

REX ROOFS.

THE specialty of the roofs constructed by the Rex Roofing Company, Belfast, consists of a light and cheap wood framing with felt covering. The roof is strong enough to carry shafting from the principals. This type of roof, with the Rex asphalte covering, will, it is believed, meet a long-felt want in districts where the air is laden with fumes and acids which are injurious to iron roofs. The company claim that Rex roofs will resist acids and alkalis, and at the same time be fire-resisting. They can be erected in single spans up to 100 feet without the obstruction of centre supports, which is a great consideration in some manufacturing concerns. There are other leading features, which are described in the descriptive leaflets which can be obtained from the offices of the company.

A STRONG ROOM.

THE resources of Hobbs, Hart & Co., Ltd., are so extensive, the limits to their power of construction cannot easily be defined. One of their latest productions is a steel strong-room, which is 18 feet long, 10 feet wide and 9 feet high. It was prepared for one of the London banks. We may say of it that it is the most recent development of the efforts to obtain security which have been in progress from the time of Agamemnon. His treasury depended mainly on the intricacy of the approaches. But Messrs. Hobbs, Hart & Co.'s treasure chamber is self-sufficient. Even if it were placed in the open air it could not be injured unless powerful explosives were employed. Throughout it is constructed of heavy steel plates of special manufacture to a thickness of 8 inches. The entrance and emergency doors are secured by patent clutch bolts, which fit into recesses in such a way that the openings are as safe as any other part of the structure. The locks, it is needless to say, have a character of their own. It would require an army of burglars to attempt an opening. Fire is also guarded against by means of chambers with fire-resisting chemicals. The strong-room is lighted by electricity, which is controlled by the opening or closing of the door, and there is not, therefore, even a remote chance of fused wires

or sparks. The workmanship is perfect, and a more substantial example of its class has not appeared. It will extend the reputation of the firm.

WINCHESTER CATHEDRAL.

AN important meeting of the Greater Chapter has been held in the chapter-room at Winchester Cathedral for the purpose of considering a report as to the defects in the structure discovered during the works of renovation which have been in progress. The meeting was presided over by the Dean, and there was a large attendance of members. The Dean reported that Mr. T. G. Jackson, R.A., had carefully examined the transepts, and that further defects in the structure had been found, one of the walls being between 4 and 5 feet out of the perpendicular. Numerous cracks had also been discovered in the walls. Mr. Jackson said that it was most important that the work should be taken in hand at once in order to make the building secure, and that to carry out the work necessary a further 30,000*l.* would be required, in addition to the 30,000*l.* for work which had already been sanctioned. It was agreed that there was no option but to undertake the task at once, and it was decided to make a further appeal to the diocese and to churchmen generally.

THE Duke of Richmond and Gordon, K.G., has offered to present to the Corporation of Chichester what is known as the Pudens Stone, which was dug up many years ago in the North Street of the city. The stone bears a Roman inscription, recording the building of a temple, "Pudens, the son of Pudentinus, giving the ground." Hitherto it has been at Goodwood House, but in future it will be exhibited at the Council House.

At a meeting of the Provincial Grand Lodge of Gloucestershire, held in the chapter-room of Gloucester Cathedral, it was decided to provide the sum of 750*l.* to defray the cost of preserving and restoring the beautiful pinnacle at the west end of the building.

VARIETIES.

THE finance committee of the Sheffield City Council recommend the Council not to effect insurances with any company under the Workmen's Compensation Act, 1906, but to undertake themselves the liability.

"A DAY at Doncaster and an Hour out of Durham" forms the subject of an interesting article by William Dean Howells in this month's *Harper's Magazine*. It is accompanied with neat illustrations of Durham Cathedral, Finchale Priory and Durham Castle.

THE War Office authorities have paid to the Petersfield Rural District Council the sum of 2,000*l.* for extraordinary traffic on the district roads. This sum has been paid on condition that the Council accept the sum eventually awarded. Negotiations for the payment for damage done to the roads have been proceeding for over two years.

THOSE responsible for the production of *Country Life* claim that it is one of the best produced journals of this country. The summer number to hand fully justifies this claim; it is well illustrated, printed on good paper and replete with interest. The central feature is a most interesting illustrated article on Chantilly, now the property of the Institut de France.

MR. JOHN YOUNG, burgh surveyor, Ayr, reports that for the past financial year seventy-one warrants were granted at the Dean of Guild Court for buildings estimated to cost 104,607*l.*, as compared with 110 warrants for buildings costing 97,547*l.* in the previous year, being an increase of 7,060*l.* The warrants granted during the year included 220 dwelling-houses, costing 60,845*l.*; twenty business premises, &c., costing 36,255*l.*; twenty-two alterations costing 4,957*l.*; and eighty-five minor warrants costing 2,550*l.*

THE Liverpool City Council, which already possesses a municipal electricity undertaking, have resolved to make application to the Local Government Board for sanction to borrow 25,000*l.* for the erection of gasworks and the laying of the necessary mains for the supply of Fazakerley, the suburban district most recently incorporated within the city, and outside the boundary within which the private gas company having a monopoly in gas supply in Liverpool has jurisdiction.

THE municipal authorities at Rotterdam have under consideration a scheme for the construction of a new port, which will be in itself as large as all the docks now existing at Rotterdam, and will be known as the port of the Waal. It is estimated that the cost will amount to two and a quarter millions sterling, out of which about 480,000*l.* will be expended in the purchase of land. The proposed port will be situated on the southern bank of the Meuse, opposite Delfshaven.

THE Truro Rural District Council have considered complaints that Giant's Quoit, Veryan, which figures prominently in the legendary and historical records of Cornwall, had been destroyed by blasting and used for road metalling. The Quoit was poised on a cairn or beacon of hard rock, and, with Giant's Cradle close by, was of archaeological interest. The surveyor said that when approaching the Quoit he stopped quarrying, but the tenant of the farm instructed his men to "blast the thing down."

EXPENDITURE to the amount of 41,648*l.* has been authorised by the Sheffield waterworks committee in preparing mains and reservoir-tanks in connection with the Derwent Valley supply. The biggest item is 25,410*l.* for a 24-inch main from tunnel end to Hadfield dam, including easements and outlet works. Tanks are to be provided at Carsick, Ringinglow and Lydgate. The city will take 7,000,000 gallons daily from the Derwent Valley.

THE Tunbridge Wells Town Council have agreed to sanction the extensions recommended by the electrical engineer, and to apply to the Local Government Board for sanction to a loan of 9,600*l.*, made up as follows:—500 kw. steam turbo alternator, condensing plant and ancillary fittings, 4,850*l.*; boiler, superheater, &c., 1,203*l.*; public lamps, 900*l.*; contingencies, approximately 10 per cent., 707*l.* 6*s.* 9*d.*

THE Worcester City Council, consequent upon consideration of a special report by Mr. Shaw, the electrical engineer, have agreed to apply to the Local Government Board for sanction to a loan of 10,000*l.*, for a further extension of the Hylton Road generating station and machinery there, and laying mains and services and providing meters, &c., and made up of the items mentioned at the foot of the resolution, viz.:—Extension of boiler-house and coal store and enlarging the Cross distributing station, 1,050*l.*;

Are you interested in WOOD PRESERVATION?

ANTHROL protects all varieties of wood from decay, whether the situation be damp or dry, and from the ravages of all wood-destroying insects, including the white ant on shore and the teredo in sea water. Rats will not gnaw wood which has been treated with

ANTHROL. Full particulars and prices will be sent on application.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The **ANTHROL** COMPANY, Kinning Park, GLASGOW; and 6 Crosby Square, LONDON.

machinery, including one 400 k.w. direct current generator, 4,150*l.*; mains, 3,800*l.*; services, 500*l.*; meters, 300*l.*; contingencies, 200*l.*

THE churchyard cross at Over Peover, near Knutsford, was last week dedicated by the Archdeacon of Chester in memory of the late Sir Philip Mainwaring. The steps and base of the old cross have been very carefully reset on new foundations, and a new shaft and head of Portland stone, 11 feet in height, now takes the place of the original cross which was destroyed in the seventeenth century. The shaft is octagonal and carries an open canopied head with a gable roof, under which the figures of Our Lord on the Cross, St. Mary and St. John stand clear against the sky. The whole work, the design of Mr. H. S. Rogers, of 7 Dean's Yard, S.W., including the resetting, has been carried out by Messrs. Farmer & Brindley, of Westminster.

A CONFERENCE of the building trades was held in London on the 6th inst., the delegates present representing a dozen trades unions, comprising a membership of about 190,000. After consideration three resolutions were agreed to, declaring that as the prosperity of a nation depended upon the spending power of the majority, it was necessary to maintain a good standard of wages, and the rapid spread of labour-saving appliances made it necessary to consider the limitation of the hours of work, that unemployment was increased by systematic overtime, and that both the employers and workers' associations ought to co-operate in abolishing unnecessary overtime. It was resolved to call a further conference to decide how to carry out the resolutions.

MR. RICHARD BELL, M.P., at Derby, on Saturday night addressed the local branch of the Building Trades' Federation. He commented on the very small audience, and, referring to men who refrained from joining their trades union, said a great number of these remained outside because they had full confidence in those within the union, and thought that whatever concessions were gained by those in the organisation would come equally to themselves. That was a manifestly unfair attitude. Other men kept aloof because the union was not perpetually agitating for an increase in wages or a reduction in hours. But the union was of great value even when not doing aggressive

work. The trades union in time of peace was like a watch-dog. A resolution was passed urging each branch of the building industry to ally itself to the local federation.

THE Patent Lightning Crusher Company, of Boundary Lane, Walworth Road, London, are introducing a new process of refuse destruction which is most efficient and economical. A few days since a demonstration took place at the Manor Place depôt of the Southwark Borough Council. The plant has been in use there for nearly a twelvemonth, and refuse which was absolutely destroyed and unrecognisable consisted of tins, rabbit skins, a horse shoe, fragments of glass, china and vegetable matter. The whole was treated most satisfactorily, and there is no doubt that the company have a process which will compare more than favourably with any other on the market, seeing that the cost of erection of the required machines is comparatively a few pounds, as against the thousands spent in erecting more expensive undertakings.

THE action of the Attorney-General *v.* The Tame and Rea District Drainage Board, which has been going on since 1899, and was last heard before Mr. Justice Kekewich in 1903, when it was ordered to stand out of the list, with liberty to either party to apply, has been restored to the list by Mr. Justice Joyce on the application of the Attorney-General. The borough of Tamworth and the District Council seek, through the Attorney-General, to obtain an injunction against the drainage board for polluting the river Tame with the effluent from their sewage farm. When proceedings were first instituted the drainage board said they would do all they could be legally called upon to do to satisfy the applicants. They agreed that, if the Court would appoint an independent engineer to go into the matter, they would construct such works as he considered necessary. The Court appointed a well-known specialist, the late Mr. Santo Crimp. Mr. Santo Crimp conducted an exhaustive examination of the sewage farm, and came to the conclusion that greater tank capacity and more filter beds for storm-water were necessary. The Board thereupon spent 120,000*l.* in nearly doubling their tank capacity and constructing four new filter beds. It is not anticipated that the case will come on for hearing before the Long Vacation.

LONDON ELECTRIC SUPPLY BILL.

THE Parliamentary committee of the London County Council recommend:—

(a) That the clauses in the London County Council (Electric Supply) Bill, 1907, providing for the compulsory acquisition of the electrical undertakings of the metropolitan borough councils by the Council, and for the transfer to the Council of the powers of purchase possessed by local authorities throughout the area of supply proposed in the Bill in regard to electrical undertakings in their several districts, be deleted.

(b) That the provision in the Bill for the expenditure of a sum not exceeding 4,500,000*l.* on the proposed undertaking be so amended as to limit any such expenditure to a sum not exceeding 100,000*l.*

(c) That the special powers sought in the Bill in regard to the breaking up of streets in London be deleted, and that the general law on the subject be incorporated in the Bill, so far as it is applicable, together with a clause dealing with routes to be followed in laying electric lines.

(d) That the powers sought in the Bill to enable the generating stations and other works comprised in the Council's tramway undertaking to be appropriated as part of the proposed undertaking be omitted, but that power be sought to enable the Council to supply surplus electrical energy from its Greenwich generating station for the purpose of the proposed undertaking, and to permit of the use of the Council's tramway ducts for purposes of the undertaking.

(e) That provision be made in the Bill to the effect that any assignment or transfer shall be subject to the following conditions, namely:—

1. The undertaking to be purchasable by the Council at the end of a period not exceeding fifty years on the terms of the Electric Lighting Act, 1888, or on such other terms as may be specified in the deed of assignment and approved by the Board of Trade.

2. The amount of dividend which may be divided by the transferees to be regulated by the prices charged by them for electrical energy on a basis to be approved by the Board of Trade.

3. The maximum prices to be charged by the transferees not to exceed those prescribed by the Bill, and such maximum prices and the relation between price and dividend to be subject to periodical revision.

4. Facilities to be granted to the Council at any time to examine accounts and works of the proposed undertaking and the assignment to contain such other provisions as may be deemed necessary for securing adequate control by the Council with regard to the powers transferred or assigned.

(f) That the Bill do provide for the cesser of the Council's powers thereunder unless a transfer or assignment has been made within a period of one year from the passing of the intended Act.

(g) That the Parliamentary committee be authorised to insert the necessary clauses in the London County Council (Electric Supply) Bill, 1907, in order to give effect to the foregoing resolutions and to make any further alterations in the Bill that may appear necessary.

ITALIAN CEMENT.

CEMENT is one of the principal industries of the district of Civita Vecchia, and the whole output of the two cement factories is contracted for and sold ahead of time. There is a steadily increasing demand for cement, so much so, in fact, that both factories are enlarging their plants. Italian cement could easily be placed on foreign markets, especially at the present time, when cement is in demand in North and South America, where, owing to the recent earthquakes, it is supplanting to a great extent bricks and stones in the building of houses, but the output of the local factories is not sent further inland than Rome. High freights prevent its being exported even to comparatively near ports. "I have been told," says the British Consul, "that the freight charge at present for a cargo of cement from Civita Vecchia to Sardinia is the same as that for the same quantity exported from Marseilles to Constantinople. Considering that a large number of vessels clear from Civita Vecchia in ballast, no doubt it would prove an easy matter to reduce rates by developing the export trade of this port and giving it a stable character."

LIABILITY FOR CHURCH BUILDING DEBT.

IN the Irish Court of Appeal, constituted of the Lord Chancellor, Lord Justice FitzGibbon and Lord Justice Holmes, judgment was given in an appeal made on behalf of three defendants, S. G. Montgomery, James Neill and John M'Meehan, in the action of James Bowman and Henry Bowman against Rev. William A. Hill and others. The plaintiffs in their action, which was heard before Mr. Justice Barton in the Court below, alleged in their statement of claim, says the *Irish Times*, that they and the defendants were, in the year 1900, at the time of the passing of a certain resolution, all members of the Board of Deacons of Hamilton Road Presbyterian church, Bangor, co. Down, and also of the congregation. This board had the management of the temporal and financial affairs of the church. Funds being required to pay off, amongst other debts, the building debt on the church, the plaintiffs and appellants entered into a guarantee with the Bank of Ireland for a sum of 4,000*l.* The plaintiffs under these circumstances claimed 1,090*l.* 8*s.* 2*d.*, their proportion, which they had repaid to the bank; to have it declared that they were entitled to a lien on the property for this sum; asked that it be enforced by a sale or receiver, and also contributions from those that were liable should the property not realise sufficient to meet the claim. The defence was a denial of any request that the plaintiffs and appellants should become guarantors; a denial that any resolution authorised them to pledge the property, and a statement that the resolution of May 30, 1900, was *ultra vires*. Mr. Justice Barton made an order that the plaintiffs were entitled to the lien, and in default of payment that there should be a sale. From this order the appeal was taken.

The Lord Chancellor, in the course of his judgment, said that by the resolution of May 30, 1900, the plaintiffs were entitled to assume that they were authorised to raise the loan; secondly, that it was for the church building; and thirdly, that it was a congregational debt. But on the other hand, neither the bank nor the members of the congregation entered into contemplation that the 4,000*l.* was to be secured on church property. The bank had no intention to look to the church premises. His Lordship referred to the lease of the ground on which the premises were built. In it, amongst other matters, trustees were nominated on

behalf of the congregation. The trusts were enumerated upon the breach of which the lessor had power to re-enter; there was to be a body of trustees to discharge the trusts according to a code, which enacted that the lease was to be submitted to the Presbytery, under whose control the Board of Deacons was to act, and that the Presbytery were to see that every lease should contain such a declaration of trust as secured the property to the congregation in connection with the General Assembly; that a sale might be made, but his Lordship said, that meant a sale consistent with the trust—not a sale that would do away with the trust. Having regard to this and the terms of the actual lease, it would have been illegal to dispose of the property otherwise than according to the terms of the code of lease. A mortgage on lien as security for the debt in question would have been wholly invalid. He was of opinion that the appeal must be allowed and the action dismissed with costs.

Lord Justice FitzGibbon, in concurring, said in the course of his judgment that the relief sought—as the foundation of the whole suit—was emphatically specific relief against the property. If the property was sufficient to satisfy the claim, no further or other relief was sought; it was only if there were a deficiency after a sale of it that contribution was sought against those who had not already contributed. In every fact that Mr. Justice Barton had stated in his summary his Lordship said he thought he was entirely right; but immediately after that the Court parted company with him. Mr. Justice Barton had said in the course of his judgment that it seemed to him that James Bowman had a very clear right of indemnity out of all the trust property of the congregation; that personal liability of the kind was not contemplated by the terms of the trust, and did not seem consistent with the condition upon which Bowman undertook the trusts. But (Lord Justice FitzGibbon continued), with all respect, if personal liability could not be established against members of the congregation as such, because it was not contemplated under this trust, this must be equally fatal as to establishing a lien against the property, which lien was not only not contemplated by the terms of the trust, but would destroy the trust itself; every witness on both sides had stated no one thought of making the church property liable for the debt by a lien, charge, or sale. case of *Minnit v. Talbot*, on which the decision was founded in the Court below, was distinguishable from the present. His Lordship held that the whole body of the congregation could not, under the circumstances, have given a mortgage on the premises, or appointed a receiver, say, by enabling him to go round with the plate on Sundays. He did not rest his decision on the law of charities, but on the most conclusive, satisfactory proof of the laws of this church and the terms of this lease.

Lord Justice Holmes, in the course of his judgment, in which he concurred, said it seemed clear to him that the intention of the lessor and the lessees was that the premises should be demised for the charitable purposes mentioned in the lease alone—a church and a manse therefor. The plaintiffs, he had not the slightest doubt, never thought that the premises would or could have been charged for a congregational debt. This had been introduced by the ingenuity of counsel.

PLUMBING AND HEATING.

A DISPUTE has occurred between plumbers and heating engineers at Leicester, which threatens to delay the completion of the new wing of the infirmary. The operative plumbers complain that men who are not plumbers, but heating engineers, have been set on to do plumbers' work, hence the stoppage of work, which has occurred under like conditions on other enterprises. The Operative Plumbers' Union wrote in April to the effect that men other than plumbers were laying pipes for the hot-water supply, and asking that the work should be placed in the hands of such operatives; while in reply it was urged that the laying of the pipes was part of a scheme for the heating and ventilation of the whole institution, and that in the opinion of the architect it was engineering work. This was the view taken by the Board of Governors, and the work went on, with the result that plumbers engaged in other parts of the building came out, with the approval of the union and also of the Employers' Association, it being urged that engineers were being paid less wages than the plumbers would have received. A conference took place under the presidency of Sir E. Wood with a view to settling the difficulty, and it was proposed that the engineers should be allowed to do

the work provided the men engaged were paid the standard rate of wages prevailing in the plumbing trade. The plumbers declined to accept this solution, claiming that the work comes within their duty and that they should do it. This was not accepted, hence the deadlock, which is unfortunate because it is delaying the completion of a much required building. The dispute is of more than local interest for the question is continually arising, and on both sides it is recognised that a settlement is desirable that shall be applied nationally.

SURVEYS FOR ROAD IMPROVEMENTS.

TOWARDS the close of his term of office as State engineer of New York, Mr. Henry A. Van Alstyne issued a manual of instructions to his staff engaged on highway improvements, which, according to the *Engineering Record*, gives a comprehensive statement of the methods which experience up to that time indicated to be best suited to secure satisfactory results. So far as the surveys are concerned these were based on transit lines, following in general the line of the existing highway. The azimuth of each line was taken, and each transit point referenced to as permanent objects as possible by at least three measurements.

The offsets to the existing fences and all other measurements of the survey within the right of way were made with sufficient accuracy to show the true location of the objects within the nearest foot. Walls, fences or other objects which indicate the boundaries of the road or of abutting property were located, and the name of the owner of abutting property noted. Where it was evident that it would be necessary to widen the road a note was made stating on which side the land should be taken and the reasons for it.

All buildings or other permanent objects within 100 feet of the transit line, or beyond 100 feet if they were of a nature to be affected by the details of the proposed improvement, were located. No more time was spent in locating objects beyond the fence lines or beyond the probable location of the improved road than was necessary to ascertain their approximate size and location, and all dimensions of

such objects were estimated in the field and recorded at once in the notes.

The magnetic bearing of each property line and intersecting highway boundary line and the station at which they intersect the base line were recorded. Where property lines or intersecting roads are definite, their apparent location was recorded, and not left for the draughtsman to locate from the sketch. The location of all drives was recorded and a tabulated list made showing their character, whether house, barn or field entrance.

Existing paved ditches, kerbing, catch-basins, railroad tracks, lines of telegraph and telephone poles and shade trees were located, and the name of the company owning the tracks or poles noted.

All bridges were located and sketch elevations, showing the design of the abutments and superstructure, size of openings, &c., drawn in the back portion of the note-book. Complete notes regarding the condition of both bridge and abutments were required.

All culverts were located and a tabular list, giving in each instance the station, size of opening, material of construction, length, condition and a recommendation regarding the proper size of new culvert, if one was necessary, was made in the back portion of the note-book. In describing the condition of culverts but two classifications were used, "good" and "bad." When a culvert was described as "good," the understanding was that it was likely to meet all requirements for at least five years after the proposed improved road was finished. When a culvert was designated as "bad," the understanding was that it was likely to utterly fail within five years from the date of the completion of the road. If a culvert was designated as "good," and any additions or alterations were necessary, the engineer was required to make recommendations regarding it and secure all data for preparing plans and estimates.

The approximate area of the watershed at each stream crossing was given if it could be readily obtained and a note made as to whether or not the water ever overflowed the road.

A tabulated list by stations of the nature of the soil was recorded in the back of the note-book, and an entry made at least every 1,000 feet whether or not the character of the soil changes. A thorough effort was made to determine the

existence of unstable soil or places which were rendered unstable by water. Inquiry was made of highway officials and occupants of adjoining lands regarding spots that broke up badly in the spring and their location recorded.

Notes were made in the back of the note-book regarding the location of quarries or outcrops of rock suitable for road material and masonry, the quality and quantity of the field stone in the vicinity of the road, the location of gravel pits, and the available places for procuring water for roller and carts.

Samples of available stone and gravel for each road were secured and forwarded with the survey books to the division engineer's office. All samples were marked plainly with the county, petition number, station, and name of the owner of the property where sample was obtained.

Information was also secured and recorded regarding distance to the nearest side-track or boat landing where stone could be delivered, and the name of railroad or waterway, the most advantageous locations for a crushing plant, prices of labourers and teams, and places where Telford, gravel base, side drains, paved ditches or any form of special construction was needed. In general, objects located by cross-section measurements were not located by transit measurements, and *vice versa*. Elevations were referred to tide-water datum by connecting with a canal, railroad or geological survey bench mark, where this could be done at small expense, and check levels were run where existing bench marks were not found near each end of the survey. Assumed elevations taken from the U. S. Geological Survey contour maps were used where no better information was obtainable.

All elevations were taken to the nearest tenth of a foot except the elevations of turning points and bench marks, which were taken to hundredths of a foot. A bench mark was established at least every 1,000 feet.

At each 100-foot station, at each change of grade, and at crossroads, elevations were taken on the base line, and at such other points on either side of the base line as were needed to plot an accurate profile and cross-section of the road.

Usually the slopes beyond the fences were merely indicated, as: Down 1 in 10, level, &c., giving the approximate distance for which the rise or fall was continuous,

but in all cases where there were cuts or fills on the existing road, where the road was narrow or where there was a probability of heavy cutting or filling-in improving the road, the cross-section was extended beyond the fence line as far as needed.

The location of the edges of the beaten track, the edge of sidewalk, line of trees, top of railfence line, and such measurements were shown in the cross-section notes by the use of letters written under the distance figures.

All elevations upon the outcropping rock were noted by the letter "R" under the distance figure, and at places where rock was near the surface soundings or borings were made to determine the depth of overlying earth, the reading and distance figures being enclosed in a circle when recorded to denote a boring.

Cross-sections were taken where there were marked changes of grade at the sides of the road, even though there was no change in the beaten track.

Elevations of the ground and of the bottom of sills were taken at the front corners of buildings where they were within 50 feet of the base line, or beyond that distance, if a cut or fill on the improved road was liable to affect the buildings.

A cross-section was taken directly over each culvert showing the elevation of the road, top of cover, top and bottom of openings, and a profile up and down the ditch far enough to give the required information for draining from the new culvert usually placed lower than the old one. Wherever, in the opinion of the engineer in charge, new culverts were needed, he indicated their proposed location and size, and took a profile along the proposed location for an outlet. Where streams entered or left the highway at places not opposite culverts, their location was noted and a profile taken far enough up and down the stream to secure all information necessary in considering the advisability of planning a new drainage system. A cross-section was taken near each culvert in addition to the regular culvert section. This cross-section was for use in the computation of the regular earthwork, as well as the culvert excavation, and showed the general elevation of the road and land immediately adjoining the culvert and stream channel.

A survey party usually consisted of six men and divided to make a location squad and a cross-section squad.

The location squad, after establishing a zero station, located a line along the road by sighting forward at some well-defined object or at a flag set as a foresight. This line was then measured and all location measurements and notes made as the survey progressed. A temporary marker was placed at every station for the use of the cross-section squad. When the survey had progressed to a point where an angle became necessary or advisable, a permanent transit point was located by driving an iron pin at the end of some even foot. This was referenced, a new foresight taken, and the base line carried forward as before. The location squad took with a transit the azimuths of all lines run, and referenced them to the magnetic north line established at station O. The magnetic bearing of each line was read and recorded as a check.

The members of the cross-section squad ran bench levels to determine the first height of instrument and then proceeded with the cross-sections. To avoid confusion a regular routine was followed in securing the rod readings and distances and in calling the information to the recorder, a common method being for the rodman to proceed first to the left, the instrumentman calling each reading, then the tapeman calling the distance, and then the rodman calling the nature of the point on which he held. On turning points after the instrumentman had called to the recorder the rod reading, the rodman checked the instrumentman's reading by sliding a card or slip of paper along the rod to the reading called, then holding the rod again for the instrumentman to observe. The rodman kept separate notes of rod readings on all turning points and bench marks and computed their elevations, and he kept the rod on each turning point until a back sight was taken.

Where a marked improvement in line or grade could be made, where the cost of maintenance in after years could be decreased, or where the grade of the old highway was so steep that a maximum grade of 7 per cent. could not be obtained with a reasonable amount of excavation and embankment, a new location of portions of the road was often advisable. When the engineer in charge of the survey party thought this was the case he promptly reported the facts to the division engineer, and unless receiving instructions to the contrary, proceeded to survey a new location along the most desirable route.

CHARLTON, LONDON, S.E.

Surveys of a new location in general proceeded as on the old highway, except that, in determining the proper alignment and grade, lower limits of curvature and percentages of grade were usually desirable, and a somewhat greater expense was justifiable to secure this result.

It was considered impossible to fix limits for curvature or grades, for while 5 per cent. may, in a large portion of the State, be a proper limit for new location grades, the importance of most roads in mountainous regions will not warrant the expense necessary to secure this low limit. No new location, however, was run on greater than 7 per cent. grades, except by direction of the division engineer, and sharp curves and angles in alignment were avoided. In running a line on maximum grade several trial lines might be necessary to secure the best results and a profile was plotted in all cases before leaving the vicinity.

Cross-sections were extended further on new location than on the old highway, especially on side-hill work, as it might be advisable to move the centre line in preparing plans. Care was taken on new location work to secure the correct names of all property owners from whom land was to be acquired and, if necessary, the county records were consulted.

Swamps, woodland, pasture, cultivated land, vineyards, &c., were carefully noted, and any data which could be obtained regarding cost of acquiring and clearing the land was noted.

Where a line for a new location was run so as to form a closed circuit with the base line in the highway, the azimuth of both the base line and the new location line was taken with a transit, and the fact that the circuit closed was ascertained before the field books were returned to the office.

Surveys for new right-of-way to be acquired were made by a party especially detailed for the purpose. The notes were placed in the original survey field-book, if this could be done without confusion; if not, they were placed in a new book of standard form. The surveys were of two kinds:—First, surveys of parcels of land along the sides of existing highways; and second, surveys of parcels of land where an entirely new location was proposed.

Plans and descriptions of parcels of land along the sides of the existing highway were prepared in the office from

the data of the original survey, unless the parcel to be required was of such irregular shape as to make its computation difficult, in which case a survey of it was made in the following manner:—An enclosing transit line was run around the piece of land along the new boundary line and the existing highway line. A magnetic bearing was taken at some angle where the needle was least subject to local attraction, and the bearing of all the sides calculated from this magnetic north, the needle reading of each line being taken and recorded as a check. The starting-point of each survey was referenced to the base line by station number and offset distance, and also to any permanent reference point in the vicinity. The angle points, points of curvature and points of tangency of the new right-of-way line were monumented with 1-inch gas-pipe rods 3 feet long, or some equally permanent monument. These were placed by the construction force when the right-of-way plan had been prepared from the data of the original survey.

In a survey where an entirely new location was made, the centre line of the proposed road, as shown on the plans, was run in with a transit, using circular curves and their connecting tangents and following the line of the original survey except at such places as were modified in preparing the plans. Unless a greater width was advisable the strip of land acquired on a new location was 60 feet wide, 30 feet on either side of the centre line. Rods of 1-inch gas pipe 3 feet long, or some equally permanent form of monument, were placed on the boundary lines of the land to be acquired at all angles, points of curvature and points of tangency.

The streets and buildings committee of Edinburgh Town Council have adopted a scheme for the improvement and widening of the bridge over the canal at Fountain Bridge by which a new steel drawbridge, 32 feet in width, and worked by an electric motor, should be erected over the canal at a cost of 4,000*l*. The cost, which includes 500*l*. in respect to approaches, falls to be entirely borne by the Corporation, the North British Railway Company being understood to have refused to make any contribution.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

IRELAND.—July 1.—The Kingstown Urban District Council invite competitive drawings for houses for the very poor. The first premium will be 100*l.* and the second 20*l.* The selected plans to become the sole property of the Council, and no further remuneration shall be paid to the architect should the Council decide to carry out the works themselves. Particulars may be obtained on a deposit of 1*s.* with Mr. M. A. Manning, town clerk, Kingstown, Ireland.

IRELAND.—July 2.—The Kilkenny Corporation invite competitive designs for a Carnegie free library, to cost not more than 1,800*l.* All particulars from Mr. E. O'Connell, town clerk, City Hall, Kilkenny.

IRELAND.—July 20.—The County of Cork Joint Hospital Board invite competitive plans for a sanatorium for consumptives with accommodation for seventy patients. A prize of 100*l.* will be paid for the plans which the Board may adopt, provided that said plans are sanctioned by the Local Government Board, and said plans shall become the absolute property of the Board. Intending competitors will receive a map of the site and other information on sending P.O. for 10*s.* to Mr. E. J. Murphy, secretary of the County of Cork Joint Hospital Board, Court House, Cork.

WEYMOUTH.—July 30.—The Weymouth Town Council invite designs for a pavilion to be erected on the north side of the pier. One hundred guineas will be awarded for the selected design, such design to become the property of the Council. Mr. H. A. Huxtable, town clerk, Municipal Offices, Weymouth.

CONTRACTS OPEN.

ALNWICK.—June 26.—For new shop front and alterations to premises, Bondgate Without. Mr. George Reavell, jun., architect, Alnwick and Morpeth.

BASINGSTOKE.—July 8.—For the erection of a Council school at Basingstoke, Hants. Deposit 2*l.* 2*s.* Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

WORKINGTON.—June 26.—For alterations to premises in John Street and Jane Street. Messrs. W. G. Scott & Co., architects and surveyors, Workington.

FLOOR SPACE IN SCHOOLS.

MR. A. G. C. HARVEY, M.P. for Rochdale, has asked the President of the Board of Education if, before the next issue of the list of public elementary schools, he will take steps to secure the publication of revised and corrected figures of accommodation by eliminating from the measurements of floor space upon which accommodation is based such portions of the school buildings as are not available for effective teaching, and by taking into consideration the existence of a proper number of classrooms. Mr. M'Kenna replied:—The figures of accommodation appearing in the list of public elementary schools represent the accommodation recognised by the Board, and do not in every case coincide with the accommodation available for effective teaching. I fear the burden on the ratepayers that would be caused by the condemnation of schools and classrooms which ought not properly to be regarded as suitable for effective teaching renders such an immediate step impossible. The Board are endeavouring to secure in all schools that not less than 10 square feet of floor space shall be provided for each child, and to remove from the list unsuitable schools and classrooms where alternative accommodation is available, or, failing this, so soon as it can be secured. The difficulty of carrying out these necessary reforms with greater rapidity lies solely in the reluctance on the part of many local education authorities to provide the accommodation required for the children displaced.

TRADE NOTES.

THE new Victoria Market Hall, Oldham, is nearing completion, and the Corporation have instructed Messrs. Joyce, Whitchurch, Salop, to supply a large clock showing the time upon three dials. The same firm are making a three-dial clock for Salford for the new offices of the Manchester and Salford Savings Bank, and another for Desborough for the Premier Cycle Co., Coventry.

MESSRS. W. POTTS & SONS, LTD., clock manufacturers, Leeds and Newcastle, have received instructions to make and fix a large clock with three external dials at Liverpool. They are also erecting one at Newcastle-on-Tyne with two large dials, and one at a church near Manchester with four illuminated dials, and one at Luffenham, Rutland, with large outside dial and striking hours. All the above are from the late Lord Grimthorpe's designs and plans.

MESSRS. OETZMANN & Co. have supplied the furniture for Sardou's "Divorçons" at the Duke of York's theatre, and it is in keeping with the period.

No. 141.

W. & T. AVERY, Ltd., Soho Foundry, BIRMINGHAM.

THE LONDON AND LANCASHIRE INSURANCE COMPANY.

WE have the pleasure of announcing that under a provisional agreement which has just been signed the Standard Marine Insurance Company, Ltd., passes under the control of the London and Lancashire Fire Insurance Company as from the 30th inst. In consideration of the transfer, the London and Lancashire will pay to the shareholders of the Standard the sum of 2*l.* per share as goodwill, over and above the net assets of that company, after deduction of all ascertained liabilities. The payment will be made in London and Lancashire shares at 24*l.* per share. The Standard Marine will continue its operations as a separate company, but it will now, of course, have greater chances of expansion and development with the strong financial backing of the London and Lancashire. The Standard Marine was established in 1871, and has had a successful career. Its last published balance sheet shows that it has a net premium income of 100,899*l.*, a paid-up capital of 100,000*l.*, and reserve funds of 175,745*l.* The London and Lancashire's capital amounts to 2,280,000*l.* and its reserve funds to 1,554,068*l.* Hitherto it has confined its operations to fire and accident business, but by this acquisition of an important marine company it will now be placed in the front rank of companies transacting fire, marine and accident business in this country.

VARIETIES.

ARRANGEMENTS are being discussed for an electrical exposition at Niagara Falls in 1908.

WESTMINSTER city hall has sustained damage from the vibration caused by motor-bus traffic in the Charing Cross Road, the ceilings throughout the building having cracked.

THE Yardley Rural District Council last week approved a scheme for certain works of surface-water drainage. The clerk was directed to apply for sanction to borrow a sum of about 13,500*l.* for the execution of the scheme.

THE Berwick Sanitary Authority have adopted a motion to apply to the Local Government Board for power to borrow money for the purpose of carrying out a joint water scheme for the borough estimated to cost 18,000*l.*

THE tender of Messrs. Cook & Son, of Crawley, has been accepted for the new municipal buildings to be erected for the Godalming Town Council. There will be an increase in the amount of about 200*l.*, as extra work has been decided on.

THE York City Council at a recent meeting adopted the report of the sewerage committee, and it was decided to make application to the Local Government Board for sanction to borrow 49,191*l.* for sewage purification works at Naburn.

THE Haywards Heath Council have received 121 applications for the post of surveyor to the Council and inspector of nuisances. At a special meeting of the Council on Monday a committee was appointed to select six of the applicants for interview with the Council.

THE Dartford Rural District Council have received an estimate of the cost of the proposed sewer through the parishes of Eynsford, Farningham and Sutton-at-Hone. The total expense is estimated at 17,100*l.* Particulars are to be sent to the parish councils concerned, and a Local Government Board inquiry is to be held.

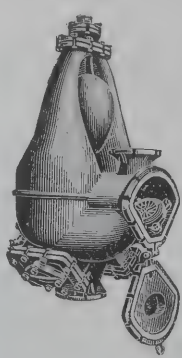

MR. E. W. DENNISON, who for twenty-seven years was connected with the firm of Clark, Bunnett & Co., has started in business with Mr. Steer and Mr. George Kett, and the firm will be carried on as Dennison, Kett & Co., makers of iron, steel and wood shutters, collapsible gates and lifts, at 11 Queen Victoria Street, E.C., and with works at 61 to 63 Lant Street, Borough.

MESSRS. GEO. TROLLOPE & SONS call our attention to the fact that several of our contemporaries in announcing the forthcoming sale of sculpture at Trentham Hall have given an incorrect date, and have asked us to call particular attention to the fact that the opening day of sale is Wednesday, July 17, and following days, commencing promptly at one o'clock each day.

THE issue of the *Pall Mall Magazine* for July contains a very interesting illustrated article from the pen of Mr. Ian D. Colvin on the "Abbey Church of Holyrood," and an article entitled "Strange Life on a London Waterway," illustrated by special photos taken by the author, Mr. William N. Beal. These two special articles, with the letterpress usually to be found, make up an exceptionally interesting number for the coming month.

THE New Palace Steamers Company announce that their full service will begin on the 22nd inst., and on the 23rd the *Koh-i-Noor* will run from Tilbury to Southend, Margate, Ramsgate, Deal and Dover and back. Special trains will run from Fenchurch Street and St. Pancras to Tilbury in connection with the boat. The *Royal Sovereign* will run daily (except Fridays in June) to Southend, Margate and Ramsgate and back, leaving Old Swan pier, London Bridge, at 9 A.M.

AN extensive improvement is about to be carried out on the M'Quistenbridge on the Kilmarnock Road at Pollokshaws East, Glasgow. The structure is narrow, and when the tramway system was extended to Giffnock it was able to accommodate only a single line of rails. The bridge is to be widened, with granite parapets. The total cost is estimated at 6,872*l.* The successful contractors are Messrs. William Kennedy, Ltd., Partick, and the amount of their tender is 5,916*l.* 19*s.* 9*d.*

THE Prestwich Council have passed resolutions approving of the Clough sewage works extension scheme, and deciding that application be made to the Local Government Board for powers to borrow 10,730*l.* Application is also to be made for powers to borrow 8,200*l.* for the main outfall sewer from the George Street works to the Clough works. The Mersey and Irwell committee has been pressing Prestwich to improve its sewage arrangements.

AT a sitting of the Glasgow Dean of Guild Court on Friday lining was granted for a further extension of the Royal Infirmary in Warnock Street and Wishart Street. The new buildings will be four storeys in height, and will be used as a nurses' home, laundry and other offices. The cost is estimated at 37,400*l.* Lining was also granted for the erection of a New Jerusalem Church, with halls and offices, in Woodlands Road, at a cost of 3,700*l.*

THERE were twenty-five cases on the roll of the Edinburgh Dean of Guild Court on the 13th inst., and thirteen applications were either passed or remitted to the burgh engineer. Permission was given to the Commissioners of His Majesty's Works to extend the Law Courts at Parliament Square. These extensions make provision for a new court and for enlarging one of the present outer house courts, as well as for additions to the advocates' library,

and the providing of rooms for officials and for restaurant purposes.

THE Dublin Corporation have passed resolutions instructing the town clerk to take the necessary steps for the promotion of a Bill in the next session of Parliament to give effect to the recommendations dealing with the question of improvement in the housing of the workers of Dublin, and also to apply to the Local Government Board for their sanction to a further loan of 10,000*l.* to meet advances to borrowers under the provisions of the Small Dwellings Acquisition Act, 1899.

At the meeting of the London County Council on Tuesday, in reply to questions, Mr. E. White, chairman of the works committee, said there had been a strike of bricklayers at the sewer works which were being carried out at Hackney. The men had been receiving as much as 6*l.* and 7*l.* per week for underground work, and had refused to work under a rearrangement by which their earnings would have been reduced. Many men were willing to undertake the work but had been intimidated.

THE Aberdeen Town Council on Monday agreed to a recommendation of the finance committee whereby a donation of 15,000*l.* will be given to the Technical College. It was stated that the governors of Gordon's College would provide a site, and that the whole sum at present in view would amount to about 50,000*l.* The Education Department would give a grant equal to the amount raised locally, which means that a total of about 100,000*l.* or thereby would be available for the scheme.

THE Lord Mayor of Birmingham presided on Monday at a meeting of the general purposes committee. A discussion took place with reference to the new Workmen's Compensation Act, which comes into force on July 1. There had been a suggestion that a new department should be created to investigate any claims which the Corporation might have made against them. It was decided to take no action, at any rate for the next twelve months. In the meantime the various committees will consider and discharge their own liabilities.

THE construction of the new seaport of Bruges is now practically completed. The outer harbour is formed by the construction of a curved breakwater 7,337 feet in length,

enclosing an area of about 272 acres. A series of locks and basins connects the outer harbour with the Bruges Ship Canal, which has a depth of $26\frac{1}{2}$ feet and a bottom width of 73 feet. The canal, $8\frac{1}{2}$ miles long, connects the town and harbour of Bruges with the sea. The cost of the work

THE Court of Appeal on Saturday, in the case of the Lancaster Rural District Council *v.* Fisher and Le Fane, allowed the defendants' appeal from a judgment of Mr. Justice Bigham in an action for damages for injury to a road near Lancaster by the defendants' traction engines during the laying of a water main as contractors on behalf of the Manchester Corporation. At the trial Mr. Justice Bigham gave judgment for the plaintiffs for 500*l.* and costs. Their lordships held that the judge was wrong in the view he took as to the limitation of the time during which proceedings could be taken by the plaintiffs. A cross-appeal by the plaintiffs on the question whether there was a contract to pay by the defendants what should be found to be due by the surveyor was dismissed.

THE Westminster City Council rejected a recommendation from the improvements committee to proceed with the widening of Chandos Street. The committee were of opinion that the most satisfactory scheme would be to widen the street to 45 feet from and including the Marquis of Granby at the corner of Chandos Street and Bedfordbury, to and including No. 44 Chandos Street. The estimated cost of this scheme was 40,000*l.* The London County Council has drawn the attention of the Westminster City Council to an opportunity for widening the Strand in connection with the rebuilding of the British Medical Association's premises at the corner of the Strand and Agar Street. The adoption of a suggested frontage would increase the width of the Strand at Agar Street to about 58 feet. The Westminster Council regards the improvement as desirable, and will give favourable consideration to the matter, with a view to contributing towards the cost when estimates and plans are before it.

A NEW Baptist church, at Shepherd's Bush, was formally opened on Thursday, the 20th inst. upon the site of the temporary building erected many years ago in Shepherd's Bush Road. Owing to its situation the architectural treatment of the exterior has been largely confined to the west front, which is of striking and graceful design in red brick

and terra-cotta of a soft grey colour, having the appearance of a natural stone. The late Gothic character of the exterior has been preserved as far as possible in the interior of the church, which is designed to accommodate about 600 worshippers. The building also contains spacious school and classroom accommodation, vestries, &c. The terra-cotta work has been carried out by the Hathern Station Terra-Cotta Co., of Loughborough, heating and ventilation by Messrs. Wontner-Smith, Gray & Co., and the seating by the Bennet Furnishing Co. The plans, selected in competition, were prepared by Mr. Percival W. Hawkins, A.R.I.B.A., of Westminster, and Mr. C. Gray, of Shepherd's Bush, was the contractor.

ANCASTER HOUSE, Richmond, S.W., on the summit of Richmond Hill, adjoining the entrance to and overlooking the park, is to be demolished and residential flats *de luxe* are to be erected thereon, to be called Queen's Court, under the supervision of Messrs. Palgrave & Co., architects, who are engaged upon the design. The site is a well-known landmark immediately opposite the Star and Garter Hotel, and was formerly the hunting-box of the Duke of Ancaster, once a seat of the Darrel family and of the late Sir Francis Burdett, Bart. The buildings are to be erected in four separate and isolated blocks connected only by a colonnade, which will form part of the architectural scheme to the main floor. There will be a frontage to the park of about 400 feet, with a return frontage to Richmond Hill and Queen's Road of about 600 feet, of which it is intended to make full use in the plans, securing to the occupiers uninterrupted views of the beautiful park scenery, and from Richmond Hill over the picturesque and delightful panorama of the Thames Valley below. The elevations will be quiet and unobtrusive, the principal ornament being gauged and carved brickwork with relief of rough-cast and green shutters. The flats will consist of from six to eight rooms, and will be approached by grand entrance hall and electric lifts. The rooms are to be spacious and lofty, and several new features are to be introduced. The buildings are to be surrounded with ornamental gardens, and a motor garage will be provided for the use of tenants. The total cost of the four blocks is not to exceed 110,000*l.*, and the architects estimate the time for completion at two years and six months.

THE new sewerage system and sewage-disposal works at Colwyn Bay were opened on Saturday last. An intercepting sewer has been built beneath the promenade from Colwyn to Rhos, and into it the sewage from all the main drains of the town flows. The intercepting sewer delivers the sewage into the pump well below the pumping station, whence it is elevated by a series of pumps driven by gas engines to a reservoir, whence commencing at the time of half water and terminating at the time of half ebb it is discharged into the sea over 2,060 feet from the face of the sea wall beyond Rhos Point. It is expected that the entire scheme will cost nearly 120,000*l.*, but the sewerage works contract has been carried out for less than the estimated 62,000*l.* The consulting engineers were Messrs. Pritchard, Green & Co., of Birmingham.

WE are informed that the Belle steamers daily service (Fridays excepted) to Felixstowe, Harwich, Ipswich, Southwold, Lowestoft, Gorleston and Yarmouth commenced on Saturday, June 15, leaving Fresh Wharf, London Bridge, at 9 A.M. weekdays and 9.15 Sundays. The daily sailings to Margate and Ramsgate will be resumed on Saturday, June 29, on which date the Husbands' Boat to Margate on Saturdays begins leaving Fresh Wharf at 2 o'clock, and calling at Tilbury only for passengers by 2.53 train from Fenchurch Street. The company this year are issuing their time-table in an extended form, having incorporated under the heading of "Where to Stay" a list of hotels, boarding and apartment houses, which will be sent post free on application.

WIRED GLASS.

A FEW years ago if Messrs. Pilkington presented an illustration of a man weighing 193 lbs. standing in the centre of a plate of glass a quarter-inch thick, the trestles being 2 feet apart, it would be considered that the feat occurred at a public entertainment and that there was a large amount of trickery employed. No less absurd in a business sense would be a representation of a similar plate which had to be subjected to a load of 433 lbs. before it was broken, and in that state could still support a load of 314 lbs. From the

time of its first manufacture glass has been proverbial for its brittleness, and it was supposed to exemplify weakness rather than strength. But the investigations concerning reinforced concrete have demonstrated that ferro-glass is an arrangement no less rational, and that the vast increase of power in one material is to be expected with glass which can amalgamate with metallic aid more readily than does cement. Fireproof buildings are a misnomer while so many weak points are presented in the form of windows. Wired glass gives security, and as it is made in several varieties it can become no obstacle to the admission of light. It has been tested by the Fire Prevention Committee, but although the glass was starred there were no holes in it. At the Woolwich explosion last February the part of the roof in which wired glass was used held firmly together and protected the machine beneath from serious damage. The ordinary sheet glass which was used in the Arsenal was shattered to pieces and fell to the ground. The result is that the glass is coming into favour not only with architects and engineers, but with contractors for glazing. Messrs. Mellows & Co. have used 300,000 feet of wired glass in the Westinghouse factory. Messrs. Helliwell & Co., the Standard Patent Glazing Co., Messrs. H. Hope & Sons, Messrs. Rendle & Co. and others have adopted it with advantage. The illustrated description which can be obtained contains lots of buildings in all parts of the country where the glass can be seen and an account of numerous severe tests to which it was subjected. The latest application is a screen for automobiles, which provides against accidents to passengers in case of collision.

MILAN INTERNATIONAL EXHIBITION, 1906.

THE report of the British Commission of the Milan International Exhibition, 1906, to Sir Edward Grey, Secretary of State for Foreign Affairs, states that the awards bestowed on the British section could hardly have been more satisfactory, and afford the best possible proof of the general excellence and representative character of the exhibits, especially when their inferiority in numbers is considered. Mr. Arthur Serena, hon. executive commissioner, says:—"The British record is highly satisfactory. The exhibitors

formed only 2.63 per cent. of the total, but they carried away 3.34 per cent. of the awards. The proportion of the awards throughout the exhibition was 0.81, France and Belgium obtaining respectively 0.69 and 0.74, and Great Britain 1.06; Germany alone obtained a higher figure (1.33). The results, in the case of Great Britain at least, were certainly not due to a preponderance of seats on the juries, as there were only 41 out of 1,317, or 3.11 per cent., whilst Germany had 107 out of the same total, or 8.12 per cent., a much heavier proportion. It would appear, however, that the success attained by Germany was chiefly due to the adoption by their Commission of a special attitude towards the International Jury which constituted a distinct, but, as it proved, a profitable innovation. They drew up lists of awards that each jury should, in the opinion of the Commission, bestow upon the exhibitors. These lists were circulated by the German representatives to the various juries, and the awards thus suggested were in the majority of cases bestowed. Returning to British exhibits, as it is undoubtedly in the higher awards that the relative superiority is most conspicuous, it may be accepted that the quality was wholly satisfactory. Of the Grands Prix one was awarded to every 10.84 Italian exhibitors, 4.49 Belgian, 4.81 French, 2.26 German and 3.23 English. One in 9.74 Italian exhibitors, 7.10 Belgian, 7.94 French, 4.06 German and 6.06 English was a recipient of a Diploma of Honour. Gold medals were bestowed on one in 4.75 Italians, 5.68 Belgians, 7.49 French, 3.48 Germans and 3.17 English. It would be difficult to point to equally good relative results at previous international exhibitions. The 340 awards bestowed upon British exhibitors do not by any means exhaust the list. In the special scholastic exhibition they obtained 16 awards; to collaborators were given 96 diplomas, while about 76 more have been awarded to members of the Commission, jurors and officials of the section. Altogether the awards reach a total of nearly 500. The verdict as to the British section must therefore be considered as one of general approval." The Commission record, among other votes of thanks, those passed to Lord Brassey, hon. president of the British Commission; to Sir Albert Rollit, president and chairman of the executive and juries' committees; and to Mr. Arthur Serena, hon. executive commissioner.

BRIGHTON AQUARIUM.

THE Aquarium committee have received a report from the borough surveyor with estimates for sundry repairs to the interior and exterior of the Aquarium buildings (exclusive of that portion of the terrace for a tenancy of which the Brighton Motor Boat Club are in negotiation) and for the restoration of the fernery, waterfall, &c., at the eastern end. The interior work chiefly consists of repairs to various tanks. The outside repairs include the painting of the western entrance, toll-house, clock tower, &c., and the iron fencing on the southern side, including the gates, putting new doors and frame, glazing and painting entrance to Aquarium from terrace, repairs to roofs, gutters, brickwork, window frames, &c., and the total estimated cost of these repairs is about 209l.

With reference to the proposed restoration of the fernery, which was situated at the eastern end of the present theatre, occupying the space now used for the stage, scenery dock and store-rooms, and was about 100 feet in depth, the report states that considerable alterations have at different times been made, large portions of the rockwork having been removed, as have also the cascade, the pools and other works. Two of the iron columns which supported the roof have been removed and brick piers substituted. The borough surveyor found the roof in very bad condition, and the greater portion will have to be reconstructed and the whole reglazed with obscured glass. New lead gutters and flashings will be required; the piers referred to will have to be removed and cast-iron columns fixed, and several openings will have to be closed up with brickwork. Over 2,000 cubic feet of rockwork will be required to make good that cut away. The pools and watercourses will have to be partly re-formed, and rustic work fences and plants provided. The engines which formerly pumped the water to supply the cascade and streams are in fair order and may be used. A good supply of water can be obtained from the well. The raised platform for the seating in the theatre will require to be removed, but so far as can be seen the tiled paving beneath is in good condition. He estimates the cost of this work at about 750l.

The committee are of opinion that the repairs are neces-

sary for the preservation of the premises, and that the restoration of the fernery and cascade would prove an undoubted attraction to the Aquarium. With the exception of the heating of the Aquarium, which may require attention at a future date, the expenditure now recommended is all that the committee consider is required to put the premises referred to in the surveyor's report in a satisfactory state of repair. They therefore recommend that the Council should authorise them to carry out the various works specified in the borough surveyor's report. It is proposed that the work should be carried out under the existing triennial contracts for painters and carpenters' work, under the supervision of the borough surveyor.

JAPANESE ARBORICULTURE.

THERE was a time, says the *New York Tribune*, when trees grew and blossomed and bore fruit as nature prescribed, and with little assistance from man. All that has been changed. The wizard of California makes trees bear almost any sort of fruit he pleases, and also prompts them to a truly American energy in the process of growing. Some trees under his manipulation will shoot up to full growth in about three years, so that we may, at this rate of progress in tree culture, soon be able to obtain the trees we want "while we wait," the waiting being done strictly on the American plan, which is never characterised by patience. Fakirs in India can make one see—or think he sees—a plant sprout, bud, blossom, leaf and fruit all in a few minutes, but the real plant miracles are wrought by Japanese, Chinese and American wizards in horticulture, who have learned some of nature's mysteries and turned them to their own ends. No nation in the world can compare with the Japanese in their development of odd shapes in evergreens. The Chinese have some wonderful old evergreens grown so that their roots form great arches under which people pass into temples, and they have trained trees into wonderful twisted shapes by braiding the young shoots, and have formed marvels in the way of roots that extend above the top-most branches of trees; but they have not achieved the remarkable results which have made Japanese landscape-gardeners rank with the great men of the empire, whose names are quoted as we would quote the name of some

artist of note. Of these Shinzaburo Suzuki carries on his mysterious art in this country, associated with Masazo Satow, who have just turned over to Mr. Vanderbilt, on his Adirondack estate, a complete Japanese garden at a cost of 30,000 dols. Mr. Suzuki has sent an expert Japanese carpenter to erect in the Japanese garden of Mr. Stokes, at Greenwich, Conn., a Japanese teahouse and summer-house, such as is to be found in every well-regulated Japanese garden, and which slides into sections in a manner as marvellous as everything else about a Japanese garden.

The strange formation of exposed roots is brought about, Mr. Suzuki says, by taking away from the roots each year from an inch to an inch and a half of earth, trimming off, at the same time, little feeding roots from the main ones. These exposed roots can be trained into any desired shape in this manner. Sometimes a root is grafted to appear like a double trunk, sometimes roots are grafted upon the main stem or branches, and hang down covered with foliage, odd specimens of root and branch combined in one. The bent and twisted stems and branches are held in place by means of small wires and a fibre which is the colour of bark, so that these never show among the branches. With the finger and thumb new shoots are constantly pinched off, only the main ones on the trunk being allowed to develop, and thus the shape of the tree is maintained. Grafting and budding give to the branches the required number of foliage twigs grown in the manner desired, and a tree will often be several times its height in the spread of its branches. In connection with constant pruning and pinching the trees to be dwarfed are planted in small pots and get just enough space to permit life, with none for natural growth. There is just sufficient moisture provided to attain the same end, and trees are treated in this manner for hundreds of years in Japan, descending from generation to generation, a precious possession in families, collections or temples. When the dwarf tree has been shaped in the desired style, it remains in this shape afterward, but the pinching of new shoots has to be kept up with the years. Rare old pines of slow growth have required from thirty to fifty years of training to make them what they are to-day—at an age of from two to four hundred years. The process, however, is not so

slow with other growths—the maple, for instance, being easily dwarfed. These dwarfed maples form exquisite lawn decorations. They come in green and in light red varieties, with many forked, feathery leaves and irregular dome shapes of wonderful delicacy and charm. A combination of a green with a scarlet maple is popular, but it is noticeable that the Japanese do not so mingle them.

CASTING REGULATIONS FOR BRASS TRADE.

THE Home Secretary has issued the draft of new regulations proposed to be enforced in connection with the casting of brass, as follows:—

Part I.—Duties of occupiers:—(1) Pouring of brass shall not be carried on unless there be (a) an efficient exhaust draught for the removal of the fumes at or as near as possible to the point of origin; and (b) efficient arrangements to prevent the fumes from entering any room in the factory in which work is carried on; and (c) free openings to the outside air in the upper part of the room. (2) There shall be provided and maintained in a cleanly state and in good repair, for the use of all persons employed, a lavatory, under cover, with (1) a sufficient supply of clean towels, renewed daily, and of soap and nail brushes, and (2) with either—(a) a trough with a smooth impervious surface, fitted with a waste-pipe without plug, and of such length as to allow at least 2 feet for every five such persons, and having a constant supply of warm water from taps or jets above the trough at intervals of not more than 2 feet; or (b) at least one lavatory-basin for every five such persons, fitted with a waste-pipe and plug or placed in a trough having a waste-pipe, and having either a constant supply of hot and cold water, or warm water, laid on, or (if a constant supply of heated water be not reasonably practicable) a constant supply of cold water laid on and a supply of hot water always on hand when required for use by persons employed. (3) No female shall be allowed to work in any process whatever in any room in which pouring of brass is carried on.

Part II.—Duties of persons employed:—(4) No person employed shall leave the premises or partake of food without carefully washing the hands. (5) No persons employed

shall carry on the pouring of brass without using the apparatus provided in pursuance of Regulation 1 (a).

Brass is defined as "any alloy of copper with zinc." In an accompanying circular it is stated that the new regulations have been prepared after careful inquiries, extending over a period of several years, into the condition of the industry and the working of the special rules. The inquiries have shown that the special rules do not adequately provide for the protection of the workers and that further precautions are necessary. The chief proposal is the requirement of efficient means to remove the fumes which arise in the process of pouring the brass. These fumes are the chief source of injury to health among those engaged in the casting shops. Great advance has been made in recent years in the direction of the local application of exhaust ventilation for the purpose of the removal of fumes, and it has been found that in other industries, where regulations similar to those now proposed for the brass trade are already in force, they have been productive of beneficial results. The Secretary of State understands that at least one form of apparatus is in use in some shops in the process of casting which successfully removes the injurious fumes, but that, as a rule, no means of the kind are provided in brass casting shops. He is satisfied that the requirements now proposed are necessary for protecting the health of the workers. If objections are taken to the regulations these will be the subject of full inquiry, and the report will be considered by the Secretary of State before the final regulations are made.

LONG GROVE ASYLUM.

ON Saturday last, the 15th inst., the new Long Grove Asylum, Epsom, erected by the London County Council, was opened for inspection. In 1889 the responsibility for providing asylum accommodation was transferred by the Local Government Act, 1888, from the county justices to the London County Council, and the asylums committee of that body—as the statutory authority—has had the serious responsibility of coping with the task of providing accommodation for the greatly increased number of lunatics. The number of lunatics in the county of London for whom the Council was responsible to find accommodation was on

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

where the "Drawwell" can be seen in action.

January 1, 1890, 10,104. On January 1 of this year the number had increased to 18,841. The increase has therefore been at the rate of over 500 a year.

The asylum now completed is the tenth for the county of London, and the sixth asylum erected by the London County Council. Early in the year 1903 the want of asylum accommodation became acute, owing to the loss of 300 beds at Colney Hatch asylum by the lamentable fire which occurred in January 1903, and in order to save time it was decided to utilise a plan which had been used for two former asylums at Bexley and Horton. The architect, Mr. George T. Hine, was, however, requested to make some important alterations and improvements in this design. By the utilisation of this plan the committee were enabled to get the sanction of the Lunacy Commissioners and the Home Secretary much more rapidly than if an entirely new design had been presented. On August 20, 1903, a contract was entered into with Messrs. Charles Wall, Ltd., for putting in the foundations. An exceptionally wet season ensued, which delayed the final completion of the foundations until November 1904. In October of the same year the tender of Messrs. Foster & Dicksee, of Rugby, for the superstructure of the entire buildings was accepted, and their contract allowed for 2½ years from December 15 in which to execute their contract, the date fixed for the completion being June 15, 1907, which, by a coincidence, is the date fixed for the inspection of the asylum. Messrs. Foster & Dicksee—although losing some three months in consequence of protracted negotiations for, and in the construction of, a branch railway from Ewell station—have used such expedition in the performance of their work that they completed the buildings nearly three months before the appointed time, the committee having possession of the main asylum on April 6 of this year.

The entire buildings are constructed to accommodate 2,020 patients. As has been said, the main asylum is designed on somewhat similar lines to those of Bexley and Horton, but with many modifications and improvements. In the first place, it accommodates 250 fewer patients, these being lodged in villas. Secondly, the entrance and official block is on the south side of the asylum instead of in its usual position on the north; this alteration being due to the southern position of the main road of approach, by which a

saving of a good half-mile is effected when approaching the building.

The patients' quarters comprise wards on each side for the different classes, viz. sick and infirm, acute and refractory, epileptics and chronic quiet and working patients—800 males and 800 females.

The wards are in continuous buildings on the pavilion principle, all intercommunicating, so that the medical officers on their rounds can pass from ward to ward quickly without having to retrace their steps by returning to the main corridors before entering another ward. There are, however, main corridors communicating with each block for general service, and through these patients will pass to the recreation-hall, workshops and laundry buildings. These corridors, unlike those in asylums generally, are merely covered ways, being open at the sides, and in consequence of this it is anticipated a more healthy condition will result and also a greater immunity from fire.

In the main asylum are the administrative departments, the offices for the staff and quarters for the medical officers and others, also a recreation-hall 120 feet by 60 feet, with well-equipped stage at one end, and adjoining this a club or recreation room for the attendants and nurses when off duty. The kitchen and kitchen offices are to the north of the hall, and beyond these are the general store and other rooms under the charge of the storekeeper.

On the women's side are the laundry buildings, comprising general officers' and foul washhouses and ironing-rooms, efficiently equipped. These and all other engineering work, comprising heating, hot-water supply, electric lighting and other electrical works, have been installed under the direction of Mr. Clifford Smith, the asylums committee's asylums engineer.

On the male side are the workshops, in which patients who are able to work are employed—tailors, shoemakers, upholsterers, also the carpenters and plumbers' workshops—and the engineers' shops and boiler-house, where steam is generated for heating, cooking, washing, &c. Electricity for lighting and power purposes is generated at the central station of the Horton estate, where the asylums' engineer has installed an electrical plant sufficient for lighting three of the existing asylums on this estate. Adjoining the boiler-house is a water tower 130 feet high, in which are

tanks holding 80,000 gallons of water for domestic use and to serve as a reservoir in case of fire, the boiler chimney being incorporated in this tower.

In addition to the main asylum there are eight detached blocks or villas accommodating 400 patients; two of these for fifty patients each are designed as hospitals for the reception of new cases, where they can be medically treated and, if cured, discharged without entering the main asylum, or passed on into one of the convalescent homes, two of which are provided for twenty-five patients each, where they can be housed in a homelike way as a probationary step before being returned to their own homes. Two other villas accommodating sixty-five patients each are erected at some distance from the asylum, for workers, one near the farm buildings for men and the other near the laundry for women. Lastly, there are two one-storey villas, each accommodating sixty quiet chronic cases, some of whom on the male side will probably work on the land, and will thus have their home in the "country" near the scene of their labours. A small isolation hospital for infectious cases completes the accommodation provided for patients.

In addition to quarters for the staff on both sides there is a detached block or home for nurses, each of whom will have a separate sleeping room, and for whom as well as for the male attendants, comfortable mess, sitting and club-rooms are also provided. A detached residence for the medical superintendent is erected away from the asylum at one end of the estate, and a detached chapel of ecclesiastical design is erected on the south side abutting on Horton Lane.

Some old farm buildings on the estate have been restored and improved, and, in addition to these, new piggeries have been erected, with a farm bailiff's house, as well as suitable garden-houses, comprising forcing and greenhouses, potting-sheds and fruit stores. The grounds are being laid out and planted with all necessary roads, airing-courts for patients, enclosed with iron fencing, and a recreation ground to the east of the asylum buildings.

It will be interesting to know that the entire buildings, including all engineering work, cooking and laundry plant, lighting, telephones, &c., also the main roads on the asylum estate, and half cost of new road through the Horton estate, cost of main sewer from the asylums, &c., to Epsom sewage

farm, contribution to Epsom Urban District Council towards extension of sewage plant, airing-courts, lodges, gates and fencing, together with professional charges, will come well within the estimate authorised by the London County Council and approved by the Home Secretary, viz. 514,313 $\frac{1}{2}$., it being now estimated that 490,000 $\frac{1}{2}$ will cover the entire outlay. This will show an average cost of 243 $\frac{1}{2}$ per bed on the 2,020 beds provided, accounting for everything excepting land and equipment.

Mr. Thomas Hunter, L.C.C., who has been chairman of the building sub-committee from the beginning, was re-elected by the new Council.

The whole of the heating and ventilating arrangements and the system of hot-water supply have been carried out by Messrs. Strode & Co., engineers, of 48 Osnaburgh Street, London. Four Lancashire boilers, each 30 feet long by 8 feet diameter, supply the necessary steam for the heating and hot-water supply apparatus. For insuring a storage of dry steam, each boiler is provided with a special steam drum 15 feet long by 3 feet diameter. The steam is generated at about 120 lbs. pressure, but for heating purposes this is reduced to about $\frac{1}{2}$ lb. pressure, the heating being worked on the atmospheric system. This system has many advantages for large buildings of this character. A positive circulation of steam vapour is maintained throughout the whole of the apparatus, all water of condensation being returned to the boiler feed tank. The radiating surfaces are rendered thoroughly effective, there being no trouble with confined air or water accumulations, and the whole system works noiselessly, with a minimum amount of attention and maximum economy. The total amount of radiator surface installed is about 30,000 square feet, and about 18 miles of piping have been fitted varying in size up to 10 inches diameter.

The hot-water supply is obtained from patent calorifiers, in which the hot water is heated by means of special steam coils. The ventilation is carried out on the natural system, fresh air inlet regulating valves being provided at floor level for the admission of fresh air, which is warmed in winter by passing over the radiators. Air extract ventilating gratings are provided at both floor and ceiling level, where vitiated air is extracted by means of upcast flues formed in the walls of the building.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

IRELAND.—July 1.—The Kingstown Urban District Council invite competitive drawings for houses for the very poor. The first premium will be 100l. and the second 20l. The selected plans to become the sole property of the Council, and no further remuneration shall be paid to the architect should the Council decide to carry out the works themselves. Particulars may be obtained on a deposit of 1s. with Mr. M. A. Manning, town clerk, Kingstown, Ireland.

IRELAND.—July 2.—The Kilkenny Corporation invite competitive designs for a Carnegie free library, to cost not more than 1,800l. All particulars from Mr. E. O'Connell, town clerk, City Hall, Kilkenny.

IRELAND.—July 20.—The County of Cork Joint Hospital Board invite competitive plans for a sanatorium for consumptives with accommodation for seventy patients. A prize of 100l. will be paid for the plans which the Board may adopt, provided that said plans are sanctioned by the Local Government Board, and said plans shall become the absolute property of the Board. Intending competitors will receive a map of the site and other information on sending P.O. for 10s. to Mr. E. J. Murphy, secretary of the County of Cork Joint Hospital Board, Court House, Cork.

WEYMOUTH.—July 30.—The Weymouth Town Council invite designs for a pavilion to be erected on the north side of the pier. One hundred guineas will be awarded for the selected design, such design to become the property of the Council. Mr. H. A. Huxtable, town clerk, Municipal Offices, Weymouth.

CONTRACTS OPEN.

MARPEDO WHITE JAPAN

SLOW DRYING.

Suitable for either exterior or interior High-Class Decorative Work, invaluable to Architects, Decorators, Ship and Yacht Builders, Railway Companies, &c. It is easy to manipulate, and large areas can be covered evenly. When dry it presents a hard, brilliant and durable surface, which will not crack. On properly prepared surface one gallon of MARPEDO SLOW-DRYING WHITE JAPAN will cover about 80 square yards. It dries in about 12 hours.

PORTLAND CEMENT.

AMONGST the many alterations made in the revision of the British standard specification we are glad to note that it is made compulsory for Portland cement to be in packages bearing the name of the manufacturer. This has long appeared to us very desirable in view of the cheap importations from abroad. Portland cement is now so largely used in building construction, owing to the development of fireproof flooring and reinforced concrete, that it is absolutely essential that the very best materials should be used, and this additional safeguard of cement being supplied in the makers' sacks is very welcome.

TRADE NOTES.

ROSE GREEN schools, St. George's, Bristol, have been ventilated on the "Boyle" natural system, under the direction of Messrs. Herbert Jones & Sons, architects, Bristol.

THE Clyde Structural Ironworks Co. have secured the contract for the erection of all the buildings in connection with a new shipbuilding yard in Austria.

THE British Flooring Company have secured the contract for the parquet floors, &c., at the new chapel, St. Nicholas parish church, Great Yarmouth. Messrs. Olley & Haward, architects.

MESSRS. PHILLIPS & SON, safe manufacturers, of Speedwell Works, Sherborne Street, Birmingham, write us that they have opened offices at Dacre House, Victoria Street, Westminster, where their London representative, Mr. John Corner, will be pleased to show anyone their safes and strong-room doors; also that their latest patent channel bolt, as an effective means of securing the doors of strong rooms, will be on view at these offices.

WE would call the attention of builders' merchants and ironmongers generally to the advertisement in our columns this week of the Harris Cycle Co., Coventry. They are a firm of long standing who have one of the finest cycle catalogues it has been our pleasure to peruse. In it are given some most interesting views of the ancient city of Coventry, among them being the far-famed St. Michael's Church. No visitor who visits Warwickshire to see Shakespeare's birthplace at Stratford-on-Avon goes away without crossing over to Coventry to see this fine old church. There are other features in connection with this catalogue which are indeed novel, and we do not doubt but that this firm are equally as diligent in making a cycle which for sound and long wear will do every purchaser justice as they are diligent in compiling their catalogue.

MESSRS. MARSDEN TILES, LTD., are at the present time supplying and fixing the whole of the tiles for the walls and floors for the Cheddleton asylum extensions, the quantity of tiles required amounting to something like 4,000 to 5,000 square yards. This firm, which is one of the oldest established tile manufacturing firms in the country, is now in the position to carry out successfully large tiling contracts, not only because of their excellent facilities as to manufacture, but also owing to their extensive range of designs suitable for all classes of architectural work. For domestic architecture they make a specialty of tiles and briquettes suitable for fireplaces and inglenooks, which are supplied in bright and also non-reflective glazes in all colours.

VARIETIES.

THE West Riding education committee have decided to erect new schools at Kinsley and Tinsley, each to accommodate 300 children and to cost 3,600*l*.

THE Chancery Division of the Irish Courts have approved of the plans of Mr. W. A. Scott and Mr. T. F. Macnamara for the orphanage which is to be erected at Bundoran. The committee have been authorised to advertise for contractors.

THE directors of the new Law Accident Insurance Society, Ltd., will be the same as those of the old company, viz. Messrs. Richard Pennington, J. S. Beale, Sam Bircham, E. H. Ellis-Danvers, W. Melmoth Walters, Romer Williams, with the addition of Mr. F. W. P. Rutter as managing director.

THE contract for the structural steel buildings for the Clarence Steelworks now being erected on the Manchester Ship Canal has been awarded to Gilbert Little & Co., Ltd., of Bradford.

THE copper system of lightning-conductors in some of the Government buildings, Calcutta, is being replaced by galvanised iron wire and terminals, owing to the copper being so frequently stolen.

AN illustrated guide to "London's Rural Retreats and Holiday Resorts" has been issued by the Great Central Railway Co. It is well adapted to serve its purpose, for the information is given without diffuseness, and the views are abundant. Lists of hotels, lodgings, &c., are supplied.

THE firm of Messrs. Marshall, Fleming & Jack, engineers and crane-builders, Motherwell, was dissolved on June 12, 1907. The business will be carried on by Mr. John Marshall and Mr. John Fleming, under the name of Messrs. Marshall, Fleming & Co., Mr. Jack retiring.

THE tramways committee of the Halifax Corporation have resolved to drop all powers of extension, amounting to about 170,000*l*. estimated outlay. Among the schemes abandoned are proposed extensions to Elland Cragg Vale, Wainshelf, Rishworth and Holywell Green.

THE Bexhill Town Council have accepted the plans for the extension of the town hall which were prepared by Mr. Henry Ward, the carrying out of which was estimated to cost 2,750*l*. The scheme provides for the addition of education and sanitary departments, with improved accommodation for existing departments.

THE tramway committee of Edinburgh Town Council, who have had before them tenders for the track and slot rails of the new Gilmore Place line of tramways, recommend the acceptance of the estimate of Messrs. Dick Kerr & Co., Ltd., for both contracts, the one amounting to 6,101*l*. and the other to 5,543*l*, or together 11,644*l*.

THE directors of the London and Lancashire Fire Insurance Company have appointed Mr. Thomas Brown to the post of local manager of their Newcastle branch, in succession to the late Mr. Samuel Butler. Mr. Brown has been in the service of the company for twenty-seven years, and for the last four years has acted as assistant local manager at its Leeds branch.

THE London County Council is negotiating with the boroughs of Fulham and Chelsea with a view to the reconstruction of Stanley bridge, over the West London Extension Railway at King's Road. The proposal also includes the widening of the approaches to the bridge to a width of 60 feet, and the estimated cost is 22,450*l*, of which the central authority is prepared to contribute two-thirds.

THE Austrian consul at Cairo, who has observed the very large demand for cement, says it is due to the enormous quantity of building which is now going on all over Egypt. The bulk of the cement trade is in British hands; we send Egypt nearly 70,000 tons a year, or four times as much as two years ago. Belgium and France also find Egypt a good

customer, but the famous Portland cement is in greatest demand.

At the Local Government Board inquiry held at East Ham on June 14, the inspector, in referring to the cost of kerbing and channelling, remarked that the cost seemed to him rather high, and added that at Brighton it was 2s. 3d. per foot while at East Ham it was 6s. 6d. Mr. Campbell, the East Ham borough engineer, has since received a note from the inspector, in which he says that he was mistaken in his observation. At East Ham the cost quoted by him should have been "per yard," and not "per foot," and thus the work would be carried out cheaper by that authority than by Brighton.

THE Norwich Town Council have received the sanction of the Local Government Board to the borrowing of 39,471*l.* for the erection of pumping plant at Trowse pumping station, for new rising main from Trowse to Whitlingham Farm, and for the construction of tanks and works for the treatment and distribution of sewage and other contingent works. The sewerage committee have been instructed to take all necessary steps to carry out the scheme and to proceed with the works, reporting from time to time to the Council.

The property committee of the Hull Corporation decided on the 21st inst. to proceed with the second portion of the town hall extension. One member objected to the recommendation of the sub-committee which had reported upon the matter. He stated that the first portion of the work, with the cost of the land, represented 60,000*l.*, whereas the original estimate was only 33,000*l.*, and the furnishing would cost an additional 5,000*l.* The question will be discussed at the meeting of the City Council.

THE Hanley Town Council have received the sanction of the Local Government Board for borrowing 1,850*l.* for sludge-pressing plant at the sewage-disposal works. With regard to the application for a further sum of 24,700*l.* in respect of sewage disposal, the Board are advised that at least 9 acres of filters would be required at the present time without making any provision for an increase. In those circumstances the Board stated they were not prepared to sanction any further loans until the Council had undertaken that the whole of the 9 acres of filters provided

for in the scheme would be completed without delay. I was on Tuesday resolved that the whole of the 9 acres of filters be put in hand at once.

At Tokenhouse Yard Messrs. Chancellor & Sons offered for sale the large Star and Garter Hotel, on Richmond Hill. The land and buildings, it was stated, had cost nearly 130,000*l.* from first to last, but only one bid of 20,000*l.* was forthcoming, though that, as Mr. Chancellor explained in withdrawing the hotel, was not far off the reserve of the vendors, who, desirous of effecting a sale, were willing to knock off the first figure of the estimated capital cost.

At the last meeting of the Holborn (London) Board of Guardians the Clerk reported that he had received twenty tenders for the repainting of the exterior wood and iron-work of the casual wards according to specifications. The highest tender amounted to 187*l.* and the lowest to 29*l.* 17s. There was another at 38*l.* 17s. and another at 45*l.* A member pointed out that some time since the lowest tender was accepted for the painting of the administrative offices. No one thought it could be done properly at the amount, but it was done to the satisfaction of all interested in the work. The lowest tender was eventually accepted.

THE Town Council of Kilmarnock had under consideration last week a proposal to extend the waterworks at an estimated cost of 25,000*l.* A letter was read from the Secretary for Scotland to the effect that the expenditure should be redeemed in thirty years. The loans on the existing works are spread over sixty years. Several members held that this was an attempt to throttle municipalisation. By ten votes to nine the Council agreed to make a strong representation to the Scottish office to have the period extended.

An inquiry was opened in the Belfast city hall on the 19th inst. by Mr. A. D. Price, engineering inspector of the Local Government Board, in connection with the application of the Belfast Corporation for the following loans:—Extension of the electric-lighting system, 75,000*l.*; erection of cottages for attendants and providing for improvements at Purdysburn fever hospital, 10,000*l.*; acquisition of additional land, water supply, drainage, electric lighting, &c., at the district lunatic asylum, Purdysburn, 8,000*l.*; constructing a bridge over the Lagan at Stranmillis, 3,000*l.*; constructing underground lavatory at Donegall Square, 2,000*l.*

THE Poplar Metropolitan Borough Council has adopted the report of the public health committee recommending that registered plumbers only be, as far as practicable, employed on plumbingwork executed for the Council or under its regulations. The report set out that the registration of plumbers after examination was a guarantee of efficiency, and in view of the fact that defective plumbingwork was usually detected only when serious results had ensued the public health committee was of opinion that the employment of registered plumbers should be decided upon.

STATISTICS from the Far Western part of the Dominion of Canada, according to the *Liverpool Courier*, show astounding prosperity. The Government has received the figures relating to building operations from thirty-seven towns, exclusive of Winnipeg, and these show that buildings actually in process of erection in these towns amount in value to 4,500,000*l.* In Edmonton, the capital of the province of Alberta, buildings to the value of 1,200,000*l.* are being erected, and the whole district is represented as being in a most thriving condition. It is stated that but for the present high prices of lumber the volume of work would be a third greater than it is.

THE Portsmouth Town Council have resolved "That, having regard to the increase in the number of places of public amusement in the borough, the watch committee consider the desirability of the Council as the Urban Sanitary Authority appointing some person to act under section 36, sub-section 3, of the Public Health Act Amendment Act, 1890, and see that the means of ingress and egress to places of public resort are from time to time kept free and unobstructed, and that if the watch committee report in favour of such appointment they recommend some person for appointment by the Council."

THE question of providing suitable accommodation at the Salford town hall has again been discussed by the town halls and markets committee of the Corporation. At a recent meeting a proposal in favour of proceeding with the erection of an annexe to the present building in Bexley Square was defeated. Most of the members of the committee spoke in favour of the building of a new town hall, and regarded the erection of an annexe at a proposed

expenditure of 20,000*l.* as "a temporary and costly expedient." The meeting was adjourned for a month. The Council rejected recently a proposal to build a new town hall at a cost of something like 200,000*l.*

AGAINST the active opposition of the Associated Manufacturers' committee, the joint committee of Parliament which is considering the Metropolitan Water Board (Charges) Bill have decided in favour of the scale of charges put forward by the promoters:—25,000 gallons per quarter and not exceeding 50,000, 1*s.* per 1,000; 50,000 and not exceeding 100,000, 10*d.*; exceeding 100,000 and not exceeding 200,000, 9½*d.*; exceeding 200,000 and not exceeding 500,000, 9*d.*; exceeding 500,000 and not exceeding 1,000,000, 8½*d.*; exceeding 1,000,000, 8*d.* The clause also provides that the Board shall not be liable to supply more than 500,000 gallons a day, or less than 25,000 gallons a quarter.

At a meeting of Croydon Town Council a discussion took place on the recommendation of the housing committee that they be empowered to bring up plans for the erection of more municipal cottages at Woodside, where the Corporation have eighty-seven cottages already. A deputation, representing twenty-five societies, waited on the Council to support the committee, and they alleged that workmen could not get sanitary houses at suitable rents. On the other hand, a councillor gave figures to show that there are 2,500 empty houses in Croydon, 1,000 of them being rented at 1*s.* and under. The committee's recommendation was rejected by thirty-six for to fifteen against.

THE Cambridge Town Council have joined the University in a request to the Local Government Board for an inquiry into the Cambridge water supply, and at a special meeting on Saturday the County Council decided to make a similar request. The water is drawn from the chalk and green sand in the valley lying to the east of Cambridge. Over this area the villages of Cherry Hinton and Fulbourn have spread themselves, and as most of the houses are supplied with cesspools there is a good deal of apprehension on the part of scientists at the University lest the water supply should become polluted. There has been nothing to justify this apprehension up to the present, the most stringent analysis having shown the water to be pure.

COLONEL CROMPTON, C.B., presided, on the 12th inst., at the concluding sitting of the Conference of Road Engineers, held at the Institution of Civil Engineers. The most important discussion was on the question of bridges. Two resolutions were proposed by Mr. H. Howard Humphreys, and ultimately passed in the following form:—"That, in the opinion of this Conference, additional powers should be given to county councils to enable them to call upon the owners of all bridges (other than county, district, or hundred bridges) carrying public roads to maintain the same in a proper condition, or, in default, to do the work themselves, recovering the cost in a summary manner;" and "That standards of loading and strength should be prescribed by the Board of Trade for all new railway, canal and drainage over bridges, and that no new bridge be allowed to be erected of a less width between the parapets than the total width of the road at that point." A resolution was adopted in favour of road and local authorities being able to fix the widths of all roads and to lay down proper building lines.

THE London County Council have consented to the erection of a building in Byward Street at less than the prescribed distance from the centre of the roadway of Seething Lane, as submitted by Mr. R. M. Roe, on behalf of Sir J. G. Tollemache Sinclair, such consent being subject to the following conditions:—"That the building be commenced within six months and completed within eighteen months from May 13, 1907; that the construction of the building be satisfactory to the district surveyor; that no bay window or other projection whatever be erected or made in advance of the building; that before the commencement of the erection of the building the whole of the land coloured blue on the said plans be dedicated to and left open for the use of the public, and that no pier, pilaster, or other projection be placed on such land; that no vault, arch, cellar or other construction be made in or under the said land coloured blue on the said plans without the previous consent in writing of the local authority, and that the building be erected and retained without any addition thereto and in exact accordance with the application for the consent, and with the plans and particulars which accompanied such application."

At Scarborough Mr. H. Shelford Bidwell, M.I.C.E., conducted inquiries on the 20th inst. into applications of the Town Council to borrow (1) 750*l.* for the construction of a new road through Columbus Ravine. (2) 2,350*l.* for the purchase of a site in Seamer Road for new Council schools; and (3) a further sum of 25,000*l.* in connection with the construction of the marine drive and sea wall round the base of Castle Hill. The town clerk related the history of the latter scheme. The work was authorised by the Scarborough Improvement Act 1899, which sanctioned the borrowing of 70,000*l.* In 1896 the Corporation accepted the tender of Messrs. B. Cooke & Co., of Battersea, of 69,270*l.* The work was commenced in June 1897, and it was to be completed in two years, but unforeseen difficulties occurred and the work had lasted five times as long. The borrowing powers sanctioned up to January 1905, were 82,700*l.*, and if the present amount asked for were sanctioned, the total outlay would have been 107,700*l.* on the drive and sea wall, in addition to 17,000*l.* for the approach road from the south, making a total of 124,700*l.*, instead of the 80,000*l.* originally asked for. The town clerk stated that there was an undertaking for the completion of the work by May 31, 1905, and the contractor was under penalties of 50*l.* a week since then if the Corporation proceeded in that matter.

THE PRESERVATION OF STONE.

UNDER the title of "Liquid Stone" Messrs. Frederick Smith & Co., of Abchurch Lane, have produced a fluid material, the use of which would revolutionise the appearance of the City. There is no trouble in its application. The surface of the building is first rubbed down to remove the dust. Two coats of the "Liquid Stone" are then laid on, after which it will be almost impossible to detect the cement from the natural stone. The whole process can be worked from ladders, no special scaffolding being required, and consequently much inconvenience and expense are saved. The composition is, moreover, a preservative, and will retain its appearance as long as natural stone, and probably longer than some varieties which are employed. Not only in London, but in nearly all the provincial towns, many opportunities are presented to utilise the new preparation.

SALFORD PUBLIC BATHS.

THE county borough of Salford has adopted a scheme for public baths which was prepared in competition by Messrs. Mangnall & Littlewoods, of Manchester. The proposed baths are intended to supply Seedley, Weaste and Hope wards, and will contain three large plunge baths, men's first and second class and one for women. There is also provided a large number of slipper baths; nine first-class men's, three first-class women's, twelve second-class men's, and six second-class women's with the necessary waiting-rooms attached. Vapour baths will be provided to the first-class parts. Every effort has been made by the architects to bring the baths up to date in all particulars. The first-class bath, which it is proposed to use for gala performances, has a large gallery, and is situated in an excellent position for affording exits and entrances. An arrangement has been made whereby the ladies, in addition to the men's first and second class, have each their own separate vestibule halls, out of which each class enter to their own respective slipper and plunge baths. With one or two minor exceptions, all parts of the baths used by the public are on the ground floor, and the parts of the baths used by the staff are in the basement. The working parts of a bath are a most important matter, having due regard to the provision of hot and cold water for baths and cleaning purposes to all the slipper, plunge and foot baths. Lavatories, &c., and a large boiler-house, pump-room and laundry have been provided for this purpose.

The elevations have been designed in the Renaissance style, and would be faced with buff terra-cotta and red Accrington bricks.

The estimated cost of the complete scheme is about 24,000*l*.

TAXES ON CATALOGUES.

THE Government of the Commonwealth of Australia have decided to establish facilities which will enable the taxes on catalogues, price-lists, show-cards and other advertising matter, intended for Australia, to be prepaid. On and after July 1 next manufacturers and others will be able to obtain from the Commonwealth offices, 72 Victoria Street, London, S.W., halfpenny, penny and threepenny duty-paid adhesive

stamps. The Australian colonies have one common tariff under which such printed matter is charged with a duty at the rate of 3*d*. per lb., but the duty is waived on all packages sent through the post which do not exceed 4 lbs. in weight. Hitherto this duty has had to be remitted by postal or money order to the Postmaster-General of the State to which the package was addressed, otherwise it would be collected as a surcharge, a proceeding that has caused a great amount of irritation and annoyance, besides loss of trade. The South African colonies are considering, and will probably adopt, similar arrangements.

NEW CATALOGUES.

THE competition between town and country is suggested by a description of the lifts manufactured by Messrs. Austin & Co., of Newcastle-on-Tyne. They contain varieties which are well adapted for industrial purposes, and which, judging by the lists appended, are extensively employed in the North of England. The catalogue suggests the power employed—whether hydraulic, belt-power, hand-power or electric-power. They also produce electric passenger-lifts, each with a controlling switch adapted to those who may prefer quick or slow speeds. A patent push-button controller is introduced, and there can also be electric locks by which all possibility of accident is removed. Over-loading is likewise made impossible as well as over-winding. The lifts uphold the reputation of Newcastle for machinery.

IN the catalogue of the Congo roofing of the Barrett Manufacturing Co. the descriptions are not illustrated, but are exemplified by samples of different kinds of the material which are of sufficient size to allow of testing. Instructions are also given for applying the material, which is a simple operation. It is claimed that the material is acid, steam and alkali proof, storm-resisting, rain-defying, and not affected by atmosphere or climatic changes. The base is a strong woollen felt with which a special composition is thoroughly incorporated by means of steel rollers. The surface is well adapted for the use contemplated. It has been employed in hot climates as well as in temperate, and it resists atmospheric influences successfully.

WATER-SUPPLY OF COUNTRY HOUSES.

THIS question has become of increasing importance, and in the case of many an old mansion and country house it is a very serious one. Indeed, one of the first interrogatories of a prospective buyer relates to the certainty and adequacy of the water-supply. Now that an ample supply for baths is an unquestioned necessity the urgency is heightened. It is satisfactory to be assured it can be met by a moderate expenditure, the interest on which may be set against the water rate of a town house. Messrs. Merryweather & Sons have been busy of late in dealing with such cases. The improvement in the construction of the oil-engine has rendered it a machine for estate use which can be trusted, and when fixed in conjunction with a "Hatfield" pump it forms an ideal water-raising plant. Messrs. Merryweather have recently fitted on an estate near Bridgnorth two of these pumps driven by one engine, one pump providing water from a spring for domestic service and the other from a lake for gardeners' use. The demands of the garden should in no case be neglected, and when there are dry summers they become insistent. Messrs. Merryweather have issued a small treatise dealing with the most recent methods for providing and raising water and purifying it where necessary.

PUBLIC WORKS IN CHINA.

IN a report on the trade of Shanghai by Mr. Archibald Rose, of H.M. Consular Service, it is stated that one of the events of the year 1906 in the commercial life of the port has been the commencement of the conservancy works on the river Huangpu, the short stretch of water lying between the actual port and the main branch of the river Yangtse. For many years grave anxiety has been felt on account of the gradual silting up of the channel, and the question was placed officially before the Chinese Government in the Peace Protocol of 1902. The river is blocked by the outer bar at Woosung, which has been hailed by generations of Chinese as a heaven-sent barrier against the invasion of the

outer world, and every device of official opposition has been brought forward to prevent the establishment of effective conservancy works. After much discussion, however, the Government was brought to a realisation of the seriousness of the position, and by the Conservancy Convention of 1905 Mr. de Rijke was deputed as superintending engineer to remove the outer and inner bars and to deepen the channel for a stretch of 15 miles. Work has now actually commenced, and normal lines have been designed by the engineer with the object of narrowing the banks, directing the current into one broad stream, and thus enabling the river to accomplish its own work in deepening the channel and keeping the bars from silting up. By the terms of the Convention all work is to be submitted to public tender, and estimates have already been called in for the building of a jetty across the outer bar and the dredging of the main channel. The expense of the conservancy has been undertaken entirely by the Chinese Government, which has promised a yearly grant of 460,000 taels (about 70,000*l.*).

BUILDING MATERIALS IN CANADA.

AT the opening of the building season for 1907 several problems of more than passing significance have to be faced, says the *Canadian Architect*. The season is already late, and building operations are in many districts almost a month behind. In the cities this backward state of affairs is not so pronounced, although even in Toronto building construction is not what it would have been had more favourable weather prevailed. However, this is by no means a serious matter. The scarcity of material, particularly of lumber, presents a difficulty whose ultimate effect on the building industry for 1907 is problematical. Pine is scarcer than ever before in the building industry of Canada, and, at the prices which are being asked for it, builders are not in any anxiety to purchase. During this season several new departures in the way of substituting hitherto less popular woods than pine for structural purposes may be looked for. For the coarser grades of pine, spruce is being substituted,

The Blue Process for Plan Copying**MARION'S
FERRO-PRUSSATE PAPER**

has stood the test of over half a century and is still superior to all others. It is in use all over the world wherever Tracings require to be copied. Anyone can work it—exposure to light and washing in water being all that is needed.

and for flooring it will probably become ere long a popular wood. The time has passed when unlimited quantities of all classes of lumber caused contractors to look with disfavour on anything but pine for house construction. Now, it is a question of what is available. Hemlock, a few years ago almost despised for anything but the very roughest construction, is now at a premium, and the supply for the present season is very limited. The problem of securing suitable material for inside finish is also a pressing one, and before the present season closes, pine, which hitherto has been the staple finish, will have been replaced by cheaper substitutes, in smaller dwelling-houses at least. Lath and shingles are in much the same condition. Pine lath is no longer in great demand; spruce is rapidly taking its place. The shingle market at the present moment presents an aspect which is more than puzzling. There are practically no shingles in Ontario lumber yards, and inquiries for them are coming in constantly from the smaller dealers to the city yards. The Western railroads have been merely dribbling shingles eastward for months past, and as Ontario manufactures comparatively few shingles and no considerable quantity can be expected from Eastern Canada, owing to the strong call for the New Brunswick shingle from the Eastern States, the situation appears serious indeed. At the present moment there are orders with British Columbia dealers for 1,200 cars of shingles, and an average of only three cars a day is being shipped. Substitutes may, of course, be obtained. There is slate, much more expensive, to be sure, and various kinds of metallic roofing, but these have not yet come into general popularity.

The stringency in the lumber market will inevitably turn men's attention to other materials which may advantageously be substituted for lumber. Among the first of these, of course, is concrete. The price of Portland cement, which advanced about 50 cents a barrel last summer, has up to the present remained stationary, but prices throughout the country vary, and in some instances the advance over last year is 50 per cent. This is due to the tremendous demand. To meet it new mills are being set up, and a number of established concerns are doubling and trebling their capacity.

With the increased use of cement must also be con-

sidered the growing demand for crushed stone. In Toronto alone the consumption of crushed stone for 1905 was 68,000 tons, and for 1906 103,000 tons. It is expected that this year 130,000 tons will be a conservative estimate of the consumption. Last year the price was 1.20 dol. per ton, and this year 1.25 dol.

The use of galvanised iron is increasing enormously each year, Canada's consumption for last year being 12½ per cent. over that of 1905. The value of Canada's importations is at least a million and a quarter dollars at point of shipment, which would be equal to more than a million and a half delivered in Canada. The price of iron has advanced during the last year on an average of about 10 per cent., which does not more than cover the actual advance in the price of steel billets from which sheets are rolled. The price of galvanised sheets used for cornices, gutters, pipes, &c., remains about the same as last year. Tinplates used for fireproofing purposes such as covering doors, lining elevator shafts, &c., are about the same as last year. Copper sheets, of which material there is not so much used as formerly, are much higher than last year, the increase in price being about 50 per cent. Roofing felt advanced 12½ per cent. this year owing to the scarcity of wool rags, out of which felt is made. These rags are now being used for manufacturing of tweeds, &c., to a greater extent than ever before, thus forcing up the price. Dry felt at the mills has gone up in the last year about 25 per cent., but roofing pitch remains about the same. Slate is about 5 per cent. lower than last year. Asbestos, which has come into general use since the Chicago fire, is lower than last year by about 5 per cent. Paints and oils show a slight stiffening in price over last year. White lead and turpentine are the most interesting items to the painter just at present. The latter has been steadily rising year by year, and substitute after substitute has been put forth only to be rejected.

TAR FOR ROADWAYS.

A PAPER on "The Use of Tar for Roadways," by Mr. H. P. Maybury (Maidstone), was read at the meeting at Dublin of the Institution of Gas Engineers. It stated that since the passing of the Motor Car Act, 1903, the question

of the satisfactory maintenance of the main roads in the country had become a serious one. In a comparatively few years a revolution in the use of the national highways had taken place, and much greater progress had been made in three years in getting "Back to the roads" than had taken place in ten times that period in the "Back to the land" proposition. Perhaps since its freedom from legislative restrictions, no industry in modern times had made such headway as that of motor manufacture. Giving evidence before the Royal Commission on Motor Cars in October 1905 Mr. T. F. Woodfine, the secretary of the Society of Motor Manufacturers and Traders, stated that, up to that date, no less a sum than 6,000,000*l.* had been invested as capital in undertakings for motor-car construction. The same gentleman stated that the then wages bill of such undertakings represented 1,189,730*l.* per annum. At this moment, in the county of London alone, upwards of 25,000 motor cars had been registered. In the county of Kent in the year ended March 31, 1906, no less than 1,151 cars were registered, and during the year ended March 31 last, a further 643; the total number registered at the end of the last financial year in Kent being 3,099. Other counties, particularly those in the home district, showed increases in about the same ratio. With this great augmentation of an entirely new kind of traffic, it was no wonder that the roads in many instances had been found unsuitable, and that a great public outcry had been raised against the high speeds attained, and the dust nuisance occasioned thereby. That the roads should at all have supported this enormous additional traffic redounded to the credit, in no small degree, of the local governing bodies and their officers. As had been pointed out, 25,000 cars were registered with the London County Council. These cars travelled over the main roads maintained by the rural ratepayer, while the fees for registration went into the coffers of the London County Council, and the same unfair incidence obtained in all the great centres of population. There was reason for hope, having regard to his remarks in the recent Budget speech, that the Chancellor of the Exchequer had the whole matter of local taxation under consideration, and that at an early date a scheme would be propounded which should be more equitable, and that the cost of road improvement and dust abatement would be more

directly put upon the users of the road. Motorists as a body would not object to increased license duty if the funds derived therefrom were utilised for road improvement purposes. With additional Imperial aid the local governing authorities and their technical advisers would be found equal to making dustless roads, and in pursuance of this the author was of opinion gas manufacturers would materially benefit. Since 1903 many experiments had been made and numerous chemical compounds had been used with more or less satisfactory results, but it was now generally conceded that nothing was so effective as coal tar. The Royal Automobile Club, in conjunction with the Motor Union, recently offered prizes for the best machine for applying tar to the roads, and also for the best tar preparations. The author had the honour of being asked to join the committee appointed to adjudicate in this matter, and it was extremely gratifying to him to find the premier gas company of Great Britain among the competitors submitting preparations, while one of their officers—Mr. Reeson—exhibited a machine for its distribution. It was common knowledge now that the use of tar for road purposes was far removed from the experimental stage. For many years it had been the recognised treatment of some of the most important roads in Paris. Tar treatment had been a failure in some instances, but it had always been due to the non-observance of scientific and climatic conditions. In most of the home counties tar spreading operations were now being undertaken upon an extensive scale, notably in Essex, Surrey and Kent, the writer having instructions to treat some 200 miles of the most important roads from London to the coast. The cost of this treatment would be borne in equal shares by the districts desiring it and the County Council. Although the subject of road construction and maintenance was far removed from those generally dealt with and interesting to the members of the Institution of Gas Engineers, still, as a modern practice seemed to point to an increased demand for such an important by-product as tar, with the co-operation of managers of works and the surveyors of highways it was not unlikely that in the near future not only would the roads be made more congenial, but that also the credit side of the gas engineers' ledgers would be appreciably improved, due to the increased demand for this by-product.

Are you interested in WOOD PRESERVATION?

ANTHROL protects all varieties of wood from decay, whether the situation be damp or dry, and from the ravages of all wood-destroying insects, including the white ant on shore and the teredo in sea water. Rats will not gnaw wood which has been treated with

ANTHROL. Full particulars and prices will be sent on application.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

POLISHED MARBLE WORK OF EVERY DESCRIPTION.

COATOSTONE

For Interior or Exterior Decorations.

If you have a dingy looking cement front, or stone work discoloured by age and requires renovating, use the well-known **COATOSTONE**, or Liquid Stone Preparation, easily applied by ordinary brushes. This will save the expense of cleaning or dragging the face of stonework. No scaffolding required, all work done off ladders. Giving the effect of natural stone.

For further particulars apply—

THE COATOSTONE DECORATIONS CO.

THE BRITISH TUBE FLOOR. **Steelwork Plans and Estimates free.** **THE BRITISH VENTILATING PARTITION.**

DENNETT'S FIREPROOF CONSTRUCTION.

As Patented in Great Britain, Canada, and the United States.

THIS method of construction has been found to be most **ECONOMICAL, EASY OF ADAPTATION,** and possessing great **STRENGTH, RIGIDITY,** and highly **FIRE-PROOF** character. It has been subjected at various times to severe tests, and is now generally adopted by the first Architects of the day.

TESTIMONIAL.—"I have made use of Messrs. Dennett & Co.'s material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength, and its extreme convenience of application. I have made use of it in positions in which I should have found it difficult to introduce any other fireproof material; and it has this advantage, that the arches constructed of it are so entirely in one mass that they cover the space like a compact shell or inverted basin, and are, consequently, almost wholly free from lateral pressure."—GEO. GILBERT SCOTT, 20 Spring Gardens.

The . . .

I. & C. Wrought Steel "LOUVRE" VENTILATORS.

MADE IN 130 SIZES.
From 4 x 6 to 24 x 42.

Black Japanned,
White Japanned,
Nickel Plated,
Bronze Plated,
ALSO IN
Solid Wrought Brass
AND
Bronze Metal.

**LEGANCE. LOW PRICE. NO BREAKAGE.
SPECIFIED BY ARCHITECTS.**

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass pulley (no cord or tassels).

These Ventilators being made entirely of **Wrought Steel**, breakage either in transportation, in stock or in use, is practically impossible. They are light in weight, with a consequent **Saving in Carriage**. The Operating Slide is made of very heavy gauge steel, and is especially **strong** to insure against breakage and guaranteeing a free and **active operation**. Each Ventilator is packed in a separate cardboard box, and is furnished with one brass Pulley (no cord or tassels).

Sold by all First-class Builders' Merchants.

WM. E. PECK & CO. (Inc.), 8 Bradford Avenue, London, E.C.

RUBEROID**ROOFING AND DAMP COURSE.**

*THE CHEAPEST FOR FLAT ROOFS.
THE BEST FOR ALL ROOFS.*

While the price enables you to put a permanent Roofing on your temporary buildings, **RUBEROID** is essentially a permanent roofing for permanent buildings. Its qualities have been thoroughly proved during the past fifteen years. The fact that our sales run into millions of feet per annum is our best testimonial.

These journals have the largest circulations, and are the recognised Organs of the Boot and Shoe Trade.

THE

LLANGOLLEN ADVERTISER,

Denbighshire,

Merionethshire, and North Wales Journal.

Published every Friday Morning.

The *Advertiser*, which has been established thirty years, has a very large and influential circulation throughout North Wales. Being conducted entirely on neutral principles, it finds its way into families of all classes. As it is also the only paper printed and published in this district, it offers peculiar advantages to advertisers.

HUGH JONES, Castle Street, Proprietor.

SOUTH WALES DAILY NEWS.—Pre-eminent as an advertising medium, affording exceptionally wide and effective publicity throughout Wales and the West of England, particularly amongst the commercial and moneyed classes. No appeal for capital in the above-named district can be successful without recourse being had to the *South Wales Daily News*, which each day has a special article on "South Wales Finance."—Chief Offices: Cardiff, London: 46 Fleet Street, E.C.

SOUTH WALES ECHO.—Eight editions daily, 36 columns, ½d. One of the largest and most attractive evening papers in the provinces. Circulation greater than that of all the other evening papers in Wales and Monmouthshire added together.—Chief Offices: Cardiff, London: 46 Fleet Street, E.C.

CARDIFF TIMES (Weekly, 1d.)—For thirty years at the head of the weekly press of Wales and the West of England. One of the largest penny weeklies in the world. On being reduced from a 2d. to a 1d. paper it attained a circulation of 81,155 copies. Chief Offices: Cardiff, London: 46 Fleet Street, E.C.

Provincial Newspapers.

The Birmingham Daily Gazette,

The Great Morning Newspaper of the Midlands.

Celebrated the 150th anniversary of its uninterrupted existence on November 16, 1891. Is now connected by

PRIVATE WIRE with its London Office 47 Fleet Street, E.C.

The Birmingham Weekly Mercury,

Issued from the same Office.

Is freely acknowledged to be the most readable Paper in the World.

Offices: 52 & 53 High St., Birmingham.

THE

BRISTOL TIMES & MIRROR

IS THE BEST, LARGEST, AND

Most Widely Circulated Paper IN THE

WEST OF ENGLAND AND

The Recognised Medium FOR ALL

HIGH-CLASS ADVERTISEMENTS.

BRISTOL: Small Street.

LONDON: 49 FLEET STREET.

THE THREE LEADING PAPERS OF THE WEST.

ESTABLISHED 1790.

Recognised as the most up-to-date newspaper and most influential advertising medium in the West of England.

THE BRISTOL ECHO.

Six Editions Daily, ¾d.

Bristol's most largely circulated and most popular Evening Paper.

THE BRISTOL WEEKLY MERCURY

FIRST ISSUED 1715.

Newsiest and best Weekly Newspaper in the Western Counties. A great Family Organ, and a most successful advertising medium.

Proprietors—THE BRISTOL MERCURY, LTD., 35 Broad St., BRISTOL; 174 Fleet St., LONDON.

THE DERBYSHIRE COURIER

IS THE

Oldest Newspaper in Derbyshire

(Outside the County Town), and is one of the best

Advertising Mediums.

It is and has been for over Seventy years a recognised organ for the publication of

COUNTY ADVERTISEMENTS, and its columns are largely used by

PUBLIC AUTHORITIES, by RAILWAY and OTHER COMPANIES,

And by AUCTIONEERS and SOLICITORS, for announcements requiring wide publicity.

Offices: HIGH STREET, CHESTERFIELD.

THE

STAFFORDSHIRE ADVERTISER.

ESTABLISHED 1795.

THE PRINCIPAL COUNTY PAPER IN THE MIDLANDS.

Advertisers will find it the best medium for reaching superior class of readers over large area centred by Staffordshire, fifth county in population and sixth in wealth.

Published at Stafford every Saturday (price 2d.) by J. & C. MORT, and to be obtained at Euston and Principal Bookstalls between London Liverpool and Manchester.

FRIDAY, PRICE 2d.

S. EDGE CUMBE - ROGERS, 27A FARRINGTON STREET, E.C.

READING MERCURY and BERKS COUNTY PAPER.

GENERAL ADVERTISER FOR BERKS, BUCKS, HANTS, OXON AND WILTS. Saturday, 2d.

Established 1728. Enlarged January 1897.

READING MERCURY and BERKS COUNTY PAPER.

Circulates in Reading, Newbury, Hungerford, Wantage, Wallingford, Abingdon, Oxford, Faringdon, Marlow, Maidenhead, Blackwater, Bracknell, Henley, Wokingham, Kingsclere, Thatcham, Camberley, Ascot, Windsor, Slough, Mortimer, Pangbourne, Sandhurst, Swindon, Basingstoke, Wycombe, Staines, &c.

READING MERCURY and BERKS COUNTY PAPER.

Advocates the interests of agriculture and commerce and all measures for the social, moral, and intellectual improvement of all classes. Relied upon by all parties for the accuracy and impartiality of its reports of public and political proceedings, and for its complete local and general information.

READING MERCURY and BERKS COUNTY PAPER.

Offers unusual advantages as an Advertising Medium, since from its vastly increased and wide circulation, and its influential position among the English Newspapers, Advertisements are brought under the notice of thousands of readers each week. All communications should be addressed to THE PUBLISHERS, "MERCURY" OFFICE, READING.

WEST SUSSEX COUNTY TIMES AND STANDARD.

Eight large Pages=56 long Columns.

Two Editions a week. One Penny.

Devotes considerable space to Agricultural Matters.

Best Family Paper in the County.

Unsurpassed as an Advertising Medium.

Only paper printed and published in the large district of which Horsham is the centre, and being the sole organ of the overwhelmingly predominant political party, its subscribers include nearly the whole of the Nobility Clergy, and leading Agriculturists in West Sussex.

SALES BY AUCTION.

By Order of the City Lands Committee of the Corporation of the City of London.—The Site of the Old Sessions House, Old Bailey.

MESSRS. JONES, LANG & CO. are instructed to LET BY AUCTION, on Building Lease, for 90 years, at the Mart, Tokenhouse Yard, E.C., on Monday, July 23, 1907, at Two o'clock, in Three Lots, the very valuable SITE, now occupied by the Old Sessions House, Old Bailey, a few doors from Ludgate Hill, in the City of London: the property has the very important frontage of about 150 feet and a depth of about 100 feet, with a total ground area of about 17,585 feet, and is well adapted for the erection of extensive Blocks of Offices or Warehouses.

Particulars, with plan and conditions of letting, can be had of the Comptroller, Guildhall: the City Surveyor, Guildhall, E.C.; or of the Auctioneers, 3 King Street, Cheapside, London. Branch Offices: 27 Chancery Lane, and 25 Leadenhall Street, E.C. Telephone, 830 Central.

No. 59 Fleet Street and 2 Pleydell Street, City of London.—An important Freehold Property to be Let by Auction on Building Lease for 90 years.

MESSRS. JONES, LANG & CO. are instructed to LET BY AUCTION, at the Mart, Tokenhouse Yard, E.C., on Monday, July 23, 1907, at Two o'clock, the very valuable BUILDING SITE, now occupied by Messuages, known as Nos. 59 Fleet Street and 2 Pleydell Street, having a frontage of about 16 feet to the former, 18 feet to the latter, and a total ground area of about 1,075 feet super, forming an admirable opportunity for the erection of a modern Block of Shops with offices.

Particulars, with plan and conditions of letting, can be had of Messrs. Pedley, May & Fletcher, solicitors, 25 Bush Lane, E.C.; and of the Auctioneers, 3 King Street, Cheapside, London, E.C. Branch Offices: 27 Chancery Lane and 25 Leadenhall Street. Telephone, 830 Central.

IMPORTANT ANNOUNCEMENT.

TRENTHAM HALL.

Stoke-upon-Trent, Staffordshire.

About one mile from Trentham Station, on the North Staffordshire Railway, and 3 miles from Stoke-upon-Trent.

NOTICE OF SALE BY AUCTION on the Premises of the whole of the valuable SCULPTURES in marble and bronze (ancient and modern) in the gardens and hall, amongst which are rare museum examples of the best periods of Early Grecian, Græco-Roman and Early Imperial times.

The statues, fountains, vases, &c., are exceptionally interesting, and comprise examples of great rarity and value. Also a collection of pictures by or attributed to

Wm. Alston. H. Howard. J. M. Nattier.
T. W. Hooschaert. C. C. Holland. Thos. Phillips, R.A.
A. S. Coello. John Jackson, R.A. Kneiberg.
De Witt. George Jones, R.A. Sir A. Vandyck.
Michael Dahl. Sir G. Kneller. Varley.
Charles Deane. C. Ketch. R. Wilson, R.A.
Holbein. Sir Peter Lely. Rich. Westall.
N. Hilliard.

And others. A few Engravings, together with a considerable quantity of Furniture, including console tables with valuable marble tops, cabinets, tables, two fine Early English dessert services, quantity of coppers, &c.

MESSRS. TROLLOPE have received instructions to SELL the above by AUCTION, on the Premises, on Wednesday, July 17, 1907, and following days, commencing at One o'clock precisely each day. May be viewed on Monday and Tuesday preceding the Sale.

Catalogues of the Furniture can be obtained free, or complete illustrated catalogues of the Sculptures and Pictures, price 6d. each, from Messrs. Trollope, 14 Mount Street, Grosvenor Square, W.; Hobart Place, Eaton Square, S.W.; West Halkin Street, Belgrave Square, S.W.; and 5 Victoria Street, Westminster, London.

By order of the Executors of C. J. Edney, deceased.

BLOOMSBURY.—FREEHOLD.—The valuable BUILDING SITE known as No. 25 Devonshire Street, and 33a Queen Square, having a frontage of 44 feet and a return frontage of about 100 feet, giving a superficial area of about 4,400 feet, forming an important site for the erection of an institution, flats, garage or business premises. Possession on completion.

MESSRS. MOSS & JAMESON will OFFER the above by AUCTION, at the Mart, on Monday, July 8, 1907, at Two o'clock.

Particulars and plan of Messrs. Chamberlain & Co., Solicitors, 1 Stone Buildings, W.C.; and the Auctioneers, 77 Chancery Lane, W.C.

TENDERS.

TO CONTRACTORS.

THE Standing Joint Committee of the Lancashire County Council invite TENDERS for the Erection of a new Police Station at Sankey, near Warrington.

The plans may be seen and bills of quantities obtained by payment of a deposit of 25 (which will be returned upon receipt of a bona-fide tender), at the office of the Architect.

The Committee do not bind themselves to accept the lowest or any tender.

Tenders are to be sealed and endorsed and are to be forwarded on or before the morning of July 13, 1907, to

HENRY LITTLE, County Architect,

16 Ribblesdale Place, Preston.

BOROUGH OF BRECON.

THE Corporation of Brecon invite TENDERS

for Alterations and Improvements to the Guild Hall.

Plans and specifications may be seen at the office of the Borough Surveyor, Castle Street, Brecon.

Tenders, marked "Guild Hall," must be delivered at my office on or before July 5 next.

The lowest or any tender will not necessarily be accepted.

G. HYATT WILLIAMS,

Town Clerk.

Town Clerk's Office, Guild Hall, Brecon:

June 11, 1907.

DURHAM COUNTY ASYLUM, SEDGEFIELD.

THE Visiting Committee are desirous of

receiving TENDERS for the Erection of Ten Cottages.

Plans and conditions of contract may be seen, and bills of quantities obtained, after Wednesday, the 26th inst., at the office of Mr. William Crozier, A.M.I.C.E., County Architect, Shire Hall, Durham, to whom sealed tenders are to be delivered not later than 10 A.M. on Monday, July 8, endorsed "Tender for Cottages."

The Visiting Committee do not bind themselves to accept the lowest or any tender.

A. O. SMITH,

Clerk to the Visiting Committee.

Durham: June 20, 1907.

TENDERS.

LONDON AND NORTH-WESTERN AND GREAT WESTERN JOINT RAILWAYS.

THE Joint Committee of the London and North-Western and Great Western Railway Companies are prepared to receive TENDERS for the Erection of Four Cottages near Hooton Station, Cheshire.

Plans and specification and deed of contract may be seen and forms of tender obtained at the office of the Joint Engineer at Woodside Station, Birkenhead, on and after June 17.

Bills of quantities will be supplied by the Joint Engineer on payment of One Guinea, which will be refunded on receipt of a bona-fide tender.

Tenders, addressed to the undersigned, and marked outside "Tender for Cottages at Hooton," will be received on or before Monday, July 1.

The Committee do not bind themselves to accept the lowest or any tender.

A. E. BOLTER,

Secretary to Joint Committee.

Paddington Station, London:

June 13, 1907.

URBAN DISTRICT OF BLACKROCK.

To Builders, &c.

THE Urban District Council of Blackrock are

prepared to receive TENDERS for some Structural Alterations in the Assembly Room, Town Hall, Blackrock.

Plans and specifications can be seen and full particulars obtained at the Town Hall, Blackrock. Materials must be, as far as possible, of Irish manufacture.

The contractor to pay the standard rate of wages, and to observe the usual hours of labour in operation in the district.

Tenders, which are to be on the prescribed forms, must be lodged with me on or before Four o'clock P.M. July 2 next.

Contractors when tendering to give the names of two solvent sureties willing, if required, to join in a bond of £100 for the proper execution of the work.

The Council will not be bound to accept the lowest or any tender.

By Order,

E. FINLAY HERON,

Town Clerk.

Town Hall, Blackrock, co. Dublin:

June 20, 1907.

COUNTY COUNCIL OF DURHAM.

New Council Schools at Houghton-le-Spring, Dean Bank (near Ferryhill), and Pelton.

SOLE TENDERS are invited for the Erection of the above Schools. Plans, specifications, and general conditions of contract may be seen and bills of quantities obtained as follows:—

For Houghton-le-Spring School.—At the office of Messrs. W. & T. R. Milburn, 29 Fawcett Street, Sunderland.

For Dean Bank School.—At the office of Mr. T. W. T. Richardson, 57 High Street, Stockton-on-Tees.

For Pelton School.—At the office of Mr. J. W. Hanson, 79 King Street, South Shields.

Sealed tenders, endorsed "Houghton-le-Spring, Dean Bank, or Pelton Council School Tender," are to be sent to the undersigned on or before Tuesday, July 2, 1907.

The Council do not bind themselves to accept the lowest or any tender.

A. J. DAWSON,

Clerk to the Education Committee.

Shire Hall, Durham: June 12, 1907.

CORPORATION OF GLASGOW.

To Masons and Joiners.

THE Corporation invite OFFERS for the Reconstruction of a Portion of the Police and Fire Station Buildings at Allison Street and Craigie Street, Crosshill.

Specifications and forms of offer may be had on application at the Office of Public Works, City Chambers, 64 Cochrane Street.

Sealed offers, marked outside "Offer for Reconstruction of Police, &c., Buildings," must be lodged with the Subscriber on or before Thursday, July 4 proximo.

The lowest or any offer may not be accepted.

A. W. MYLES, Town Clerk.

City Chambers, Glasgow:

June 20, 1907.

TO BUILDERS.

THOSE desirous of TENDERING for the

Erection of a proposed Village Institute at Weston-Rhyn, near Preesgwynne, Salop, can see the plans at the office of the Architects, Messrs. Douglas & Minshull, 6 Abbey Square, Chester, from whom bills of quantities can be obtained on payment of Two Guineas, to be refunded on receipt of a bona-fide tender.

The lowest or any tender not necessarily accepted.

TO CONTRACTORS.

Cumberland Education Committee.

New Secondary Schools at Carlisle and Brampton.

TENDERS are invited for the Whole of the Works required in the Erection and Completion of a New Mixed Secondary School at Brampton and a New Girls' Secondary School at Carlisle, in accordance with plans and specifications prepared by Messrs. Grayson & Ould, architects, 31 James Street, Liverpool.

Copies of bills of quantities can be obtained for Brampton School on and after June 24, and for Carlisle School on Saturday, July 6, upon application at the Architects' Offices—price One Guinea for Brampton School and Two Guineas for Carlisle School, which will be returned upon receipt of a bona-fide tender. Plans and specifications may be seen at the same address, as well as at the County Education Offices, The Courts, Carlisle.

The lowest or any tender not necessarily accepted.

No part of the work may be sub-let without the consent in writing of the Architects.

Sealed tenders, endorsed with the name of the school, must be received by the undersigned not later than the First Post on Saturday, July 13, 1907.

By Order of the Education Committee,

C. COURTENAY HODGSON, Secretary.

The Courts, Carlisle: June 20, 1907.

HAVANT JOINT HOSPITAL DISTRICT BOARD.

To Builders, Painters and Others.

THE Board invite TENDERS for—

(1) The Erection of a Temporary Hospital in the Grounds of the Royal Free Hospital, Havant.

(2) Painting, &c., the inside and outside of the Administrative Block, Offices, &c.

Plans and specifications can be seen at my office between 10 A.M. and 4 P.M. any day (except Saturdays), and sealed tenders, endorsed "Tender for Temporary Hospital" and "Tender for Painting," must be delivered at my office by 1 P.M. on Thursday, July 4 next.

The Board do not bind themselves to accept the highest, lowest or any tender.

By Order,

E. E. LONGCROFT Clerk.

Havant: June 22, 1907.

TENDERS.

TO PAINTERS AND OTHERS.

THE Guardians of the Poor of the Parish of Paddington invite TENDERS for Painting and other works at their Infirmary in the Harrow Road.

A copy of the specification and form of tender may be obtained at the offices of the Architect, Mr. E. Howley Smith, Mowbray House, 14 Norfolk Street, Strand, W.C., on payment of a deposit of One Pound (by cheque), which will be returned to persons sending in a bona-fide tender and returning the specification.

The Contractor will be required to pay to the workmen employed by him not less than the rate of wages from time to time mutually agreed upon by the Central Association Master Builders of London and the representatives of the unions of the various branches of the building trade.

Sealed tenders, endorsed "Tender for Painting the Infirmary," must be delivered at the offices of the Guardians before Five o'clock on Tuesday, July 16.

The Guardians do not pledge themselves to accept the lowest or any tender.

By Order,

HENRY F. AVELING,

Clerk to the Guardians.

Guardians' Offices, 313-319 Harrow Road, W.: June 5, 1907.

POPULAR AND STEPNEY SICK ASYLUM DISTRICT

Tender for Alterations and Additions to Reception Block and Nurses' Home at the Bromley Asylum.

THE Managers of the above-named District

are prepared to receive TENDERS for proposed Works, Building Additional Storeys to Reception Block, &c., of the Bromley Asylum of the Popular and Stepney Sick Asylum District, in accordance with drawings and specifications prepared by their Architects, Messrs. J. & W. Clarkson, 136 High Street, Poplar, E.

The drawings and conditions of contract may be seen at the offices of the Architects, as above, on and after Monday, the 24th inst., and a copy of the bills of quantities and form of tender obtained upon payment to the Architects of a deposit of £5, which amount will be returned upon receipt of a bona-fide tender.

Tenders sealed and endorsed "Tender for Alterations to Reception Block," addressed to me at the Asylum, Devon Road, Bromley-by-Bow, E., must be delivered to me, by hand or registered post, not later than 4 P.M. on Tuesday, July 2, 1907.

Persons tendering will be required to name two sureties each of whom must be willing to be bound in half the amount of the contract for the proper fulfilment of the same.

Parties tendering will be required to declare that they pay the rate of wages and observe the hours of labour that they are generally recognised by the trade unions and considered fair in the trade.

The Managers are to have the power to accept any tender within two months of July 9, 1907, and they are not bound to accept the lowest or any tender.

By Order,

WALTER R. FOSKETT,

Clerk to the Managers.

Devon's Road, Bromley-by-Bow, London, E.: June 17, 1907.

ABERTILLERY URBAN DISTRICT COUNCIL.

EDUCATION COMMITTEE.

To Builders and Contractors.

TENDERS are invited for the Erection of a

Council School for Boys at Laundry Road for the Abertillery Education Committee.

Drawings and specification may be inspected at the office of N. Gasenius Lewis, Esq., F.R.I.A.S., Architect, Abertillery, on or after June 24, 1907.

Bills of quantities supplied by the Architect on deposit of Two Guineas, which will be returned on receipt of a bona-fide tender.

The contract agreement will contain clauses indemnifying the Committee against claims for damage caused in carrying out the works and under the Workmen's Compensation Acts and a clause binding the Contractor to pay union rates of wages.

The Committee do not bind themselves to accept the lowest or any tender.

Tenders, endorsed "Laundry Road School," to be in my hands not later than Twelve o'clock noon on Thursday, July 4, 1907.

By Order,

N. J. LLEWELLYN, Secretary.

COMPETITION.

KILKENNY CORPORATION.

To Architects.

COMPETITIVE Designs, Specification and

Bill of Quantities are invited for the Erection of a Carnegie Free Library by the Kilkenny Corporation. Cost of building not to exceed £1,800. Designs to be sent to me not later than Tuesday, July 2, 1907.

The successful competitor, provided his designs are approved of by Mr. Carnegie, will be appointed architect for the work of erection of the library. All designs to be sent in under a "non-de-plume."

Any further information can be obtained from me.

EDWARD O'CONNELL, Town Clerk.

City Hall, Kilkenny.
